When lobate, the *pseudopodia* remain distinct from one another, their margins are clear and transparent, and the granules which they may contain plainly flow into their interior from the more fluid central part of the body. But, when they are filiform, they are very apt to run into one another, and give rise to networks, the constituent filaments of which, however, readily separate, and regain their previous form; and whether they do this or not, the surfaces of these *pseudopodia* are often beset by minute granules which are in incessant motion."—*Huxley: Anat. Biol.: (See extract).

"The young [of viviparous Aphides] are developed within organs which resemble the ovarioles of the true females in their disposition, and may be termed *pseudovaries.* The . . . anterior chamber of each pseudovariau tube is lined by an epithelium, which encloses a number of nucleated cells. One of the hindermost of these cells enlarges, and becomes detached from the rest as a pseudovum. It then divides, and gives rise to a cellular mass . . . which gradually becomes fashioned into the body of a larval Aphis. A portion of the cells of which it is composed becomes converted into a *pseudovarium*, and the development of new pseudova commences before the young leaves the body of its parent. It is obvious that this operation is comparable to a kind of budding. If the pseudovum remained adherent to the parental body the analogy would be complete."—*Huxley: Anat. Invert.*, pp. 447, 448.

The bright-hued fur of some of these bats is probably due to protective mimicry. Dobson (*Cat. Chirop.*, p. 17, Note †) says:

PTEROPUS.

"Any one who has seen a colony of these Bats suspended from the branches of a banyan-tree, or from a silk-cotton tree, must have been struck with their resemblance to large ripe fruits; and this is especially noticeable when they hang in clusters from the leaf-stalks of the cocoanut-palm, where they may be easily mistaken for a bunch of ripe cocoanuts."

Supported by this finger, the side of the body, and the comparatively short hind limb, was a patagium, or flying membrane. The bones were pneumatic. Chief genera: Pterodactylus, Dimorphodon, Rhamphorhynchus, Pteranodon, and Ornithopterus. Prof. Seeley, having regard to the ornithic type of brain, and the pneumaticity of the bones of the Pterosauria, places them in a distinct class, Ornithosauria which he regards as most nearly related to, but coequal with, the class Aves. Ptolemaic-system, *s.*

Astron.: The hypothesis maintained by Ptolemy in his *Almagest* that the earth was a fixed body, remaining constantly at rest in the centre of the universe, with the sun and moon revolving round it as attendant satellites. To account for the more complicated movements of the planets, a contrivance was devised by which each planet revolved in a circle, whilst the centre of that circle described another circle round the earth, for the ancient physicists refused to admit that any movement except in a circle could be perfect. The Ptolemaic system prevailed till Copernicus propounded what is now accepted as the true system of the universe, and Prof. Ball (*Story of the Heavens*, p. 6) says of the old theory that "though so widely divergent from what is now known to be the truth, it did really present a fairly accurate account of the movement of the planets." By extension, the name is applied to other species of the genus. The Common Puffin is well known all rouud the British coasts, and gives its name to one of its haunts—Puffin Island, off Anglesea. It is rather larger than a pigeon; plumage glossy black above, under-surface pure white; feet orange-red; bill very deep, and flattened laterally, particoloured—red, yellow, and blue, and grooved during the breeding-season, and undergoing a kind of moult at its close—a peculiarity shared by other species. (Cf. *W. Bingley: Tour Round North Wales*, i. 309, and a paper by Dr. Bureau, in *Bull. Soc. Zool. France*, ii. 377-399, an abstract of which appeared in the *Zoologist*, July, 1878.) Puffins lay a single egg—white, with gray markings—in a burrow sometimes excavated by themselves, but frequently in one from which a rabbit has been driven. It is right, however, to state that Cains expressly declares (*Rarior. anim. lib.*, fol. 21) that the name is derived '*a naturali voce pupin*.' Prof. Skeat says that the word is a diminutive, which favours the view that it was originally used as a name for these young birds."—*Prof. Newton*, in *Encyc. Brit.* (ed. 9th), xx. 101. (Note.)

For the transference of sense cf. *horse* = a kind of frame; Fr. *poutre* = a filly . . . a beam; *chèvre* = a goat . . . a crane; Eng. *crane* = in its double meaning; Gr. ὄνος (*onos*) = an ass, a crane, a pulley, &c.]

1. *Mech.:* One of the six simple machines or mechanical powers. It consists of a small circular plate or wheel which can turn round an axis passing through the centres of its faces, and having its ends supported by a framework which is called the block. The circular plate has a groove cut in its edge to prevent a string from slipping off when it is put round the pulley. With a single fixed pulley (that is one in which the block in which the pulley turns is fixed), there is neither gain nor loss of power; for, as the tension in every part of the cord is the same, if a weight be suspended at one extremity, an equal weight must be applied at the other to maintain equilibrium. Hence, the effect of a fixed pulley is simply to change the direction of a force. By means of moveable pulleys one can gain mechanical advantage, greater or less, according to the number and mode of combination of the pulleys. This advantage may be computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. Thus:

In a single moveable pulley with the strings parallel when there is equilibrium the weight is twice the power.

It may, therefore, be considered a lever of the second class, in which the distance of the power from the fulcrum is double that of the weight from the fulcrum.

In a system of pulleys in which each pulley hangs by a separate string and all the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by $2n$, where n is the number of pulleys.

In a system of pulleys in which the same string passes round all the pulleys and the parts of it between the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by the number of strings at the lower block.

In a system of pulleys in which each string is attached to the weight, and all the strings are parallel when there is equilibrium, the weight is equal to the power multiplied by 2^n-1, where n is the number of pulleys.

The young, when born, are spotted with brown, and the tail is ringed. The puma is destructive, and slays far more than it can eat, but rarely, if ever, attacks man, and may be tamed with little difficulty. Edmund Kean had one which followed him about like a dog. It owes its cellular structure to the enormous expansion of aqueous vapour consequent on the relief from pressure during the extrusion of vitreous lavas at the earth's surface.

1. *Lit.:* A machine, engine, or device, consisting of an arrangement of a piston, cylinder, and valves, for raising water or other liquid to a higher level, or for compressing or exhausting air and other gases. There are numerous varieties of pumps differing more or less in construction, according to the purposes for which each is intended, but the most important are the suction-pump, the lifting- or lift-pump, the force-pump, and the centrifugal- or rotary-pump. The simplest form of pump is that of the common lift-pump, which consists of a straight tube with two valves, one of which is fitted to the lower end of the tube, and the other is made to slide air-tight in the cavity of the tube or barrel. Both of these valves are adapted to open upwards only, and thus the water is admitted and lifted from the lower part of the tube to the discharge aperture above. The pump acts by the pressure of the atmosphere upon the external body of water from which the supply is raised, but by the forcing-pump water may be raised above the level to which it is driven by the pressure of the atmosphere. The forcing-pump consists of a barrel fitted with a solid piston or forcer, the barrel being also provided with a branch forcing-pipe. The lower part of the barrel and the branch-pipe are each fitted with a valve opening upwards, and by repeated strokes of the piston, the pressure of the air from above being removed, the fluid is brought up to fill the space between the two valves, and being prevented from returning by the lower valve, it passes through the upper valve of the branch-pipe into a capacious upper vessel, and there accumulating, may be ejected in a constant instead of an intermittent stream.

None of them is dated. Some quote from others, and the period of their redaction embraees perhaps a dozen eenturies. In their present form none of them appears older than the ninth century A.D. The most eelebrated are the Vishnu and the Bhâgavat Purânas. They are full of legends relating to holy plaees and eeremonial rites, with minute fragments of history. Modern Hinduism is largely founded on these compositions, some of which are sectarian productions, advocating

the claims of particular divinities to the disparagement of others. In addition to the eighteen principal Purânas, there are eighteen Upapurânas or secondary Purânas, enumerated by H. H. Wilson (*Vishnu Purâna*, Introd.), and these do not complete the list of Puranic literature.

At the latter council (sess. xxv., Dec. 3, 4, 1563) it was declared that the "souls in Purgatory are assisted by the suffrages of the faithful, and especially by the Sacrifice of the altar." Beyond this nothing is defined, and the same decree enjoins bishops "to abstain from difficult and subtle questions" in their discourses on the subject, and prohibits curious inquiries, superstitious practiees, and the making of purgatory a source of gain as "scandals and stumbling-blocks to the faithful."

Prayers for the dead—the natural outcome of the doctrine of purgatory—are in many instances offered privately by her members, and in some few instances publicly requested in her churches.

1. *Ord. Lang. & Chem.:* The apparently spontaneous decomposition of organic substances, especially those rich in nitrogen. It differs from fermentation (q.v.) in being accompanied by the evolution of fetid and noxious gases. In the process of putrefaction, organic bodies of a higher order are changed, sometimes into lower organic compounds, sometimes into inorganic compounds, as ammonia, sulphuretted hydrogen, &c., and sometimes into simple substances, as hydrogen and nitrogen. Putrefaction may be prevented, or its further progress arrested by various means:

(1) By keeping the substance in a vacuum, or in a vessel containing air which has been deprived of all organic germs.
(2) By freeing from moisture and keeping perfectly dry.
(3) By keeping the substance in an atmosphere a few degrees above 0°.
(4) By heating to the boiling point, and hermetically sealing.

From experiments made by Pasteur and others, it appears that putrefaction only takes place when a body comes in contact with living germs. (Used also figuratively.)

1. *Egyptian Antiquities:* A solid structure substantially invariable in form, viz., a simple mass resting on a square or sometimes approximately square base, with the sides facing with slight deviations towards the four principal winds, and tapering off gradually towards the top to a point or to a flat surface, as a substitute for an apex. The proportion of the base to the height is not always the same, nor is the angle of inclination uniform. The pyramids were constructed in platforms, and then revêted or coated with blocks or slabs of granite, as may still be observed in incomplete pyramids. Recently the theory has been maintained that in the case of the largest pyramids, a smaller one was erected as a nucleus, and subsequently enveloped by another layer. The interior of these massive structures contains narrow passages, and some totally dark halls or chambers, and probably served as the burial-places of the kings who had caused them to be constructed. The entrance to these buildings is raised considerably above the level of the base, and was blocked up by a portcullis of granite, so as to be on ordinary occasions inaccessible. In the pyramid of Cheops, the entrance is raised about 47 ft. 6 in. above the base. The pyramids of Egypt begin immediately south of Cairo, and continue southwards at varying intervals for nearly seventy miles. The largest is that of Cheops, at Ghizeh, standing on a base each side of which was originally 764 feet long, but owing to the removal of the coating is now only 746 feet. Its perpendicular height, according to Wilkinson, was originally 480 ft. 9 in., present height 460 ft. The principal chamber, the so-called Crowning Hall or King's Chamber, is 34 ft. 3 in. long, and 17 ft. 1 in. wide. Its roof is formed of massive blocks of granite, over which, with a view to support the weight, other blocks are laid, with clear intervals between. According to Herodotus, the erection of this pyramid employed 100,000 men for twenty years.

2. *Mexican:* The Teocallis, or Houses of the gods, which have come down from Aztec times, are four-sided pyramids rising by terraces to a considerable height. A group of such erections still exists at Teotihuacan about twenty miles north-east of the city of Mexico. There are two large pyramids, with some hundred smaller ones. The base of the largest is 900 feet long, its height 160 feet; the height of the second is 130 feet. One is dedicated to the sun, the other to the moon. A yet larger one is at Cholula; its base is 1488 feet long, its height 178 feet. All the Mexican pyramids face the cardinal points.

3. Hence, applied to any mass or heap more or less resembling a pyramid in form.

"While those deputed to inter the slain

Pope: Homer; Iliad xxiii. 201.

4. *Anat.:* A conical bony eminence in the anterior wall of the tympanum of the ear. Also that portion of the *medulla oblongata* forming the floor of the fourth ventricle of the brain; two conical eminences, known as the posterior pyramids, the *corpora pyramidalia,* leading to the *pons Varolii,* being the anterior pyramids.

5. *Geom.:* A polyhedron bounded by a polygon, having any number of sides, called the base, and by triangles meeting in a common point, called the vertex. Pyramids take different names according to the natures of their bases. They may be triangular, quadrangular, &c., according as their bases are triangles, quadrilaterals, pentagons, &c. The base and lateral triangles are called faces; the lines in which the faces meet are called edges; the points in which the edges meet are called vertices of the pyramid. A right pyramid is one whose base is a regular polygon, and in which a perpendicular let fall from the vertex upon the base, passes through its centre. The regular pyramid is a pyramid bounded by four equal equilateral triangles. It is called the tetrahedron.

pÿ-rŏm′-ĕ-tĕr, *s.* [Pref. *pyro-*, and Eng. *meter* (q.v.).] A term originally applied to an instrument in the form of a single metallic bar, employed by Muschenbroek about 1730, to indicate temperatures above the boiling point of mercury, 660° Fahr. It is now applied to any instrument used for such purpose. The first which came into extensive use was that of Wedgwood, about 1780; it was devised and used by him for testing the heat of his pottery and porcelain kilns. No fewer than eleven different modes have been proposed or actually employed for measuring high temperatures: (1) by contraction of clay on exposure to heat, as in Wedgwood's; (2) by expansion of bars of different metals; (3) by change of pressure in confined gases: (4) by the amount of heat imparted to a cold mass; (5) by the fusing-point of solids; (6) by conduction and radiation of heat, depending upon observations with thermometers of moderate range at relative distances [PYROSCOPE]; (7) by colour, as red and white heat; (8) by change in velocity of sounds depending on the change of pitch in musical notes; (9) by resolution of chemical compounds; (10) by generation of electricity, as in Becquerel's thermo-electric pyrometer; (11) by change in resistance to electricity, as in Siemens's pyrometer, which depends on the increased resistance offered by an iron or platinum wire to the passage of electricity. Of all these, the third (M. Lamy's), depending on the measurement of the tension of carbonic-acid gas developed from marble when heated, and the last are the best.

¶ Tremeschini's pyrometer is founded on the expansion of a thin plate of platinum, heated by a mass of metal previously raised to the temperature of the medium. The Trampler pyrometer is based upon the difference in the coefficients of dilatation for iron and graphite; the Gauntlet pyrometer on the difference of those of iron and fire-clay. The Ducomet pyrometer consists of a series of rings made of alloys which have slightly different melting points. In pyrometers constructed on the Watertype priuciple, the temperature is determined by noting the amount of heat communicated to a current of water of known temperature circulating in the medium to be observed. Min.: A name used for a group of minerals of very variable composition and origin, but all of which are referable (like the analogous group of amphiboles) to the same chemical type, under the general formula $ROSiO_2$, where R may represent lime, magnesia, the protoxides of iron and manganese, and sometimes soda, potash, and oxide of zinc. Two or more of these bases are always present, the most frequent being lime, magnesia, and protoxide of iron, lime being always present and in a large percentage. Sometimes these bases are replaced by sesquioxides, but always sparingly. The result of these isomorphous replacements is shown in the diversity of habit, colour, and form of its numerous varieties. Crystallization monoclinic. Hardness, 5 to 6; sp. gr. 3·23 to 3·5; lustre, vitreous to resinous; colour, shades of green, and white to black; transparent to opaque; fracture, conchoidal. The two most important divisions are Non-aluminous and Aluminous. Dana subdivides these into:

Non-aluminous: 1. Lime-magnesia pyroxene; (1) malacolite; (2) alalite; (3) traversellite; (4) muasite; (5) white coccolite. 2. Lime-magnesia-iron pyroxene; (1) sahlite; (2) halkalite; (3) protheite; (4) funkite; (5) diallage. 3. Iron-lime pyroxene; hedenbergite. 4. Lime-magnesia-manganese pyroxene; schefferite of Michaelson. 5. Lime-iron-manganese pyroxene. 6. Lime-iron-manganese-zinc pyroxene, jeffersonite.

Py-thăg′-ŏr-ĭsm, *s.* [Fr. *Pythagorisme.*]

Philos., Astron., &c.: The system of belief attributed to Pythagoras, born in Samos about 540 B.C., his mother being a Samian and his father, it is believed, a Phœnician. After travelling in Egypt, Persia, &c., in quest of knowledge, he settled in Croton, in the south of Italy, ultimately founding a society constituting at once a philosophical school, a religious brotherhood, and a political association of aristocratic sympathies. He died about 504. He never committed his system to writing. This was first done by Philolaus, one of his disciples. Pythagoras is said to have regarded numbers as the essence or principle of things, the elements out of which the universe was made, and attributed to them a true and independent existence. The principles of numbers were contrasted, as a straight line and a curve, an even and an odd, all traceable back to a monad in which both an even and an odd were included. The world was a breathing being. There were five elements, fire, air, water, earth, and one unnamed. In the central part of the universe was a fire, around which the sun, moon, and planets, with the celestial sphere itself, revolved. These were either themselves gods, or had their movements directed by gods. There existed a music of the spheres, the celestial bodies dancing a choral dance around the central fire. The soul of man was an emanation from the universal soul of the world. There was a transmigration of souls. Flesh and beans were not to be eaten. Nature was in uniformity with the will of the Deity, and human life should make an approach to the harmony of Nature. The Pythagorean system declined about B.C. 300, but revived two centuries later, and in the Augustan age the views of its advocates as to the past changes which the earth had undergone through the operation of fire, water, &c. (*Ovid: Metamorph.*, bk. xv.), were essentially so sound as to excite the commeudation of Sir Cbarles Lyell. (*Princip. of Geol.*, bk. i., ch. i.)

Q.

Q, the seventeenth letter and the thirteenth consonant of the English alphabet, a consonant having only one sound, that of *k* or *c*. It is always followed by *u*, and since this combination can be represented by *kw* (or *k* when the *u* is silent), *q* is a superfluous letter. In Latin, as in English, *q* was always followed by *u*. *Q* did not occur in the Anglo-Saxon alphabet, its sound being represented by *cw* or *cu*, as *cwic* = Eng. *quick*, *cwén* = Eng. *queen*, *cwelan* = Eng. *quail*, &c. For *qu* in English the Dutch use *kw*, the Germans *qu*, the Swedes & Danes *qv*. *Q* is most commonly found as an initial letter; it never ends a word. The name of the letter is said to be from Fr. *queue* = a tail, the form being that of an O with a tail to it.

I. *As an initial:* *Q* represents the Latin *Quintus* in inscriptions or literature; in geometry, &c., it represents the Latin *quod* (=which), as *Q.E.D.*=*quod erat demonstrandum* = which was to be shown or proved; *Q.E.F.* = *quod erat faciendum* = which was to be done, abbreviations frequently written at the end of a theorem or problem respectively.

II. *As a symbol:*

"The *quadrature* of the circle is a famous problem, which has probably been the subject of more discussion and research than any other problem within the whole range of mathematical science. The area of the circle being equal to a rectangle described upon the radius and half of the circumference, it follows that the *quadrature* would be possible if an algebraic expression, with a finite number of terms, could be found for the length of the circumference. Hence, the problem is reduced to finding such an expression, or to finding an exact expression in algebraic terms for the ratio of the diameter to the circumference. No such expression has yet been found, and it is by no means probable that such an expression will ever be found. The problem may safely be classed with the problems for the geometrical tri-section of an angle, the duplication of the cube, &c., all of which are now regarded as beyond the power of exact geometrical construction."—*Davies & Peck: Mathemat. Chem.: $C_{41}H_{46}O_{25}$. A substance extracted by alcohol from the leaves of the chestnut. It forms fine, yellow, crystalline grains of the size of poppy seeds, and is resolved by hydrochloric acid into quercetin and glucose, $C_{41}H_{46}O_{25} + 3H_2O = C_{23}H_{16}O_{10} + 3C_6H_{12}O_6$.

quĕr-çĕt′-a-mīde, *s.* [Eng. *quercet(in),* and *amide.*]

Chem.: An amorphous, orange-yellow powder, obtained by treating an ammoniacal solution of quercetin with hydrochloric acid, filtering, and adding to the filtrate aqueous ammonia. It is slightly soluble in water, but soluble in alcohol, ether, hydrochloric acid, and excess of ammonia.

quĕr-çĕt′-ĭc, *a.* [Eng. *quercet(in); -ic.*] Contained in or derived from quercetin (q.v.).

quercetic-acid, *s.*

Chem.: $C_{15}H_{10}O_7$, or $C_{21}H_{14}O_{10}$. Formed by the action of boiling potash on quercetin. It crystallizes in silky needles, which effloresce in a warm atmosphere, is sparingly solnble in cold, easily in boiling water, in alcohol, and in ether. Its aqueous solution turns yellow on exposure to the air, and is coloured dark blue by ferric chloride.

quĕr′-çĕ-tĭn, *s.* [Altered from *quercitrin.*]

Chem.: $C_{27}H_{18}O_{12}$. A yellow, crystallizable body, produced by the action of dilute mineral acids on quercitrin, $C_{33}H_{30}O_{17} + H_2O = C_{27}H_{18}O_{12} + C_6H_{14}O_6$. It is neutral, inodorous, melts about 251°; is slightly soluble in boiling water, easily in weak alcohol and in ether. Nitrate of silver and cupric oxide are readily reduced by it.

quĕr-çĭ-mĕr′-ĭc, *a.* [Lat. *quercus* = an oak; Gr. *μέρος* (*meros*) = a part, and Eng. suff. *-ic.*] Derived from or containing quercetic acid.

Chem.: $C_8H_8O_6 = C_8H_6O_5H_2O$. An acid produced by fusing quercetic acid with potash. It forms small, colourless, prismatic crystals, having an acid reaction and an astringent taste, and is very soluble in water, alcohol, and ether. Its aqueous solution gives a fine blue colour with ferric chloride.

Chem.: $C_6H_{12}O_5$. Quercin. Quercitol. Sugar of acorns. A saccharine substance obtained from the aqueous extract of bruised acorns. It crystallizes in transparent, monoclinic prisms, which are permanent in the air; melts at 235°, and is soluble in water and hot dilute alcohol. Hot nitric acid converts it into oxalic acid; but a mixture of nitric and sulphuric acids changes it into a white amorphous resin, nitroquercite, which is insoluble in water, but soluble in hot alcohol.

quĕr′-çĭ-tŏl, *s.* [Eng. *quercit(e); -ol.*] [QUERCITE.]

quĕr-çĭt′-rĭn, *s.* [Eng. *quercitr(on); -in.*]

It is yellow and crystallizable, and yields, when boiled with dilute acids, quercetin and isodulcite. In solution it is neutral, bitter, and inodorous, and strikes a dark green colour with ferric chloride. When dehydrated, it melts at 160° to a dark yellow resin.

Chem.: A yellow dye stuff, consisting of the shavings of the bark of *Quercus tinctoria.* Alum or stannic chloride is employed as a mordant. A finer yellow is said to be obtained when the decoction of the bark is previously boiled with dilute hydrochloric acid, owing probably to the liberation of quercetin. In America the bark is used for tanning.

It is the technical expression for the various reading which the ancient redactors of the text bid us substitute for the one which occupies or is written in the text, *i.e., Kethib* (כְּתִיב). The word in the text for which there is a variant has not only the vowel-points which belong to the marginal reading, but has a small circle or asterisk placed over it, which directs to the margin (קְרִי) where the emendation is given. Thus, for instance, in Josh. v. 1 the text has עָבְרְנוּ which exhibits the letters of the textual reading, *i.e.,* "*we* were passed over," with the vowel-points belonging to the *qneri* or *quere*= the marginal reading, עָבְרוּ, "*they* have passed over." 2. *Theol. & Church Hist.:* The doctrine that the essence of true religion consists in the withdrawal of the soul from external and finite objects, and its quiet concentration upon God. It is a form of mysticism, and has been held by individuals in the Church in all ages. In the fourteenth century it attracted notice in connection with the Hesychasts. [HESYCHAST.] The term was specially used to describe the views advocated by Miguel de Molinos, a Spanish priest, who settled in Rome in 1669 and 1670, under the patronage of Cardinal Odeschalchi, afterwards Innocent XI. In 1676 he published his *Guida spirituale* (Spiritual Guide), which was soon afterwards translated into Italian, French, Latin, and English. On August 28, 1687, the Inquisition condemned sixty-eight propositions in his writings, and on November 20 he was imprisoned for life, and died December 28, 1697. Among his followers was a Barnabite, François de la Combe, who instructed Madame Guyon. In 1694 a commission, with Bossuet, bishop of Meaux, at its head, condemned thirty errors in her writings. She was defended by Fénelon, bishop of Cambray, whose writings in turn were condemned in 1699 by Pope Innocent XII., and retracted by their author. It was believed that the Quietist doctrine tended to disparage the external observances of religion and substitute the authority of the individual for that of the Church. In another direction also, quietism in some cases tends to antinomianism. [FAMILY OF LOVE.] Cowper's versification of some of Madame Guyon's writings was first published at Newport Pagnell, in 1801, after the poet's death.

Nat. Science: A system of classification published hy Macleay in his *Horæ Entomologicæ* (1819–21), applied hy Vigors to ornithology in 1823 (*Trans. Linn. Soc.*, xiv. 395–517), and modified by Swainson (*Geog. & Class. Anim.* (1835), 224, 225):

1. Every natural series of beings, in its progress from a given point, either actually returns, or evinces a tendency to return, again to that point, thereby forming a circle.
2. The primary circular divisions of every group are three actually, or five apparently.
3. The contents of such a group are symbolically (or analogically) represented hy the contents of all other circles in the animal kingdom.
4. These primary divisions of every group are characterized hy definite peculiarities of form, structure, and economy which, under diversified modifications, are uniform throughout the animal kingdom, and are therefore to be regarded as the primary types of nature.
5. The different ranks or degrees of circular groups exhibited in the animal kingdom are nine in number, each being involved within the other.

Fleming (*Quart. Rev.*, xli. 302–27) pointed out the fallacies of the system, and Rennie (*Montagu's Ornithol. Dict.*) attacked it, more especially in its application to ornithology. It is now deservedly exploded.

quinic-acid, *s.*

Chem.: $C_6H_7(OH)_4COOH$. Kinic acid. A monobasic acid found in cinchona bark, bilberry plant, coffee beans, and the leaves of several plants. It is obtained from cinchona by adding milk of lime to an acid decoction of the bark, evaporating the liquid portion to a syrup, submitting the calcium quinate which separates to recrystallization, and exactly decomposing a solution of the salt with oxalic acid. The acid crystallizes in colourless monoclinic prisms, which melt at 161°, and have a sp. gr. = 1·63. It exerts a left-handed action on polarised light, dissolves in 2½ parts of cold water, is slightly soluble in strong alcohol, nearly insoluble in ether. Distilled with sulphuric acid and peroxide of manganese, it yields crystals of quinone. This reaction is very delicate. The salts of quinic acid are neutral, and for the most part crystallizable; soluble in water, insoluble in strong alcohol. *Quinate of calcium,* $\begin{matrix}C_6H_7\\C_6H_7\end{matrix}(OH)_3\begin{matrix}COO\\COO\end{matrix}Ca'' + 10H_2O$, occurs in cinchona bark, and is formed by adding calcium chloride to an alkaline quinate. It crystallizes in rhomboidal plates, easily splitting into laminæ, dissolves in six parts of water at 16°, and is nearly insoluble in alcohol.

quinic-ether, *s.*

Chem.: $C_7H_{11}(C_2H_5)O_6$. Ethylic quinate. Obtained by heating quinate of silver with ethylic iodide. Forms a yellow syrup, having a bitter taste and aromatic odour. It is easily soluble in water and alcohol, less readily in ether.

quĭn'-ĭ-çĭne, *s.* [Eng. *quini(ne)*, and *(gly)c(er)ine.*]

Chem.: $C_{20}H_{24}N_2O_2$. A yellow resinous amorphous base, isomeric with quinine, obtained by heating quinine in glycerine to a temperature of 200°. It has a bitter taste, melts at 70°, is insoluble in water, soluble in alcohol, ether, and chloroform, and exhibits a right-handed rotation.

quĭn'-īde, *s.* [Eng. *quin(ic)*; *-ide.*]

Chem.: $C_7H_{10}O_5$. Quinic anhydride. Obtained by heating quinic acid to 220°–250°. The residue is dissolved in boiling alcohol, and, when clarified, the solution is left to evaporate. It forms small crystals resembling sal-ammoniac, dissolves easily in water, has an acid reaction, and under certain conditions is reconverted into quinic acid.

quĭn'-ĭ-dine, *s.* [CONCHININE.]

quĭ-nine', *s.* [Fr., from Sp. *quinina*, from Peruv. *quina* = Peruvian-bark.]

Chem.: $C_{20}H_{24}N_2O_2$. Chinin. Quinia. The most important alkaloid of the true cinchona barks, first obtained, but in an impure state, by Gomez of Lisbon, in 1811. [CINCHONA-BARK, CINCHONA-BASES.] It is permanent in the air, inodorous, and very bitter; almost insoluble in water, but soluble in absolute alcohol, ether, and chloroform. From its alcoholic solution it crystallizes in prisms, having the composition $C_{20}H_{24}N_2O_2 + 3H_2O$, and fusing at 75°. It exerts a strong lævorotary action on polarised light, and is a powerful base, neutralizing acids completely, and forming easily crystallizable salts, which are very bitter and less soluble in water than the salts of the other cinchona alkaloids. Solutions of quinine in dilute sulphuric acid exhibit a blue fluorescence, and this is observable in solutions containing much less than one part in 200,000 parts of water.

quinine-sulphates, *s. pl.*

Chem.: The neutral or common medicinal sulphate, $2C_{20}H_{24}N_2O_2{\cdot}H_2SO_4 + 8H_2O$, is prepared by neutralizing quinine with dilute sulphuric acid. It crystallizes in long flexible monoclinic needles, having a nacreous aspect, almost insoluble in cold water, but soluble in boiling water, in alcohol, and in dilute sulphuric acid; insoluble in ether, chloroform, and petroleum spirit. The solution of quinine sulphate in water, acidulated with sulphuric acid, exhibits a powerful blue fluorescence, and turns the plane of polarization of a ray of light strongly to the left, (a)j = 255·6. In commerce it is frequently found mixed with cinchonidine or cinchonine. This may be due either to actual adulteration, or to an imperfect mode of preparation. The acid salt or soluble sulphate, $C_{20}H_{24}N_2O_2{\cdot}H_2SO_4 + 7H_2O$, separates from a solution of quinine in excess of sulphuric acid. It crystallizes in rectangular prisms, soluble in water and in alcohol. Quinine sulphate is largely employed as a febrifuge and tonic, and it possesses powerful antiseptic properties.

quinine sulphuric-acid, *s.*

Chem.: $C_{40}H_{48}N_4SO_7 = 2C_{20}H_{24}N_2O_2SO_3$. Sulpho-quinic acid. An amorphous powder, obtained by dissolving quinine in fuming sulphuric acid, neutralizing with baryta water, and decomposing the barium salt with sulphuric acid. It is soluble in water and alcohol.

Pathol.: Inflammatory sore-throat. There is swelling of one tonsil, or of both, attended with difficulty of breathing and swallowing, and febrile symptoms. Quinsy has, though rarely, proved fatal by producing suffocation, but it generally terminates favourably by resolution or suppuration. In the latter case a good deal of purulent matter is discharged, and the patient is immediately relieved. Quinsy is at times a most distressing disease, though the feeling is rather one of extreme distress than of acute pain, except when the attempt to swallow is made. In some cases the swelling extends down the neck and completely under the jaws, affecting the tongue and the salivary glands. When this occurs the flow of saliva is generally profuse, and in all cases there is formation of much stringy mucus about the tonsils. Along with these local symptoms there is always more or less fever, and, in case of continuance of the disease, depression from the deprivation of nourishment. A person who has suffered from quinsy should, after recovery, use every means of strengthening the throat, as a guard against future attacks.

"The ancient Greeks said there are four elements or forms in which matter can exist:—Fire, or the imponderable form; air, or the gaseous form; water, or the liquid form; and earth, or the solid form. The Pythagoreans added a fifth, which they called ether, more subtile and pure than fire, and possessed of an orbicular motion. This element, which flew upwards at creation, and out of which the stars were made, was called the fifth essence; *quintessence,* therefore, means the most subtile extract of a body that can be procured." —*Brewer: Dict. Phrase & Fable*

quĭ-pū', **quĭ-pō' (qu as k),** *s.* [Peruv. *quipo* = a knot.]

Anthrop: An instrument used for reckoning or recording events, the invention of which is ascribed to the Emperor Suy-yin, the Prometheus of China. The Chinese are said to have used them till they were superseded by the art of writing. The quipu has been found in Asia, Africa, Mexico, among the North American Indians, but in Peru quipus served as the regular means of record and communication for a highly-organized society. The Peruvians appear to have been particularly expert in its use, being able by its employment to keep on record not only statistical information, such as the number of soldiers, the quantities of the crops, the contents of the Inca's warehouses, &c., but also information of a historical character to which such a system would seem completely unfitted. The records thus kept must have been very simple, since their details must otherwise have been liable to misapprehension, even to one skilled in the use of the quipu. (See extract.)

"The *quipu* is a near relation of the rosary and the wampum-string. It consists of a cord with knots tied in it for the purpose of recalling or suggesting something to the mind. When a farmer's daughter ties a knot in her handkerchief to remember a commission at market by, she makes a rudimentary *quipu* . . . . Von Tschudi describes them as consisting of a thick main cord, with thinner cords tied on to it at certain distances, in which the knots are tied. The length of the *quipus* varies much, the main trunk being often many ells long, sometimes only a single foot, the branches seldom more than two feet, and usually much less . . . . The cords are often of various colours, each with its own proper meaning: red for soldiers, yellow for gold, white for silver, green for corn, and so on. This knot-writing was especially suited for reckonings and statistical tables; a single knot meant ten, a double one a hundred, a triple one a thousand, two singles side by side twenty, two doubles two hundred. The distances from the main cord were of great importance, as was the sequence of the branches, for the principal objects were placed on the first branches and near the trunk, and so in decreasing order. This art of reckoning . . . is still in use among the herdsmen of the Puna."—*Tylor: Early Hist. Mankind* (ed. 1878), pp. 154-156

1. A flattish disc or ring of iron of about 8½ to 9½ inches in diameter, and from 1 to 2 inches in breadth. It is bevelled towards the outer edge, which is sufficiently sharp to enter into moderately soft ground. It is convex on the upper side, and slightly concave on the lower.

"The distance of a *quoit's* cast from his tent."—*Hackluyt: Voyages*, i. 355.

2. (*Pl.*): The game played with the rings described in 1. The ground is from 21 to 30 yards long, and two pins, technically known as hobs, are stuck in the ground (usually a stiff clay) at a distance of 18 to 24 yards apart. The players, each of whom has two quoits, are divided into sides, and standing at one hob throw their quoits in turn as near the other hob as they can, endeavoring if possible to ring it, that is, to cause the hob to pass through the centre of the quoit. The player or side which has thrown the quoit nearest to the hob, provided it has cut into the ground, or has not turned over on its back, scores one point towards game, or if the quoit rings the hob two points. The game may be any number of points. The sport resembles the ancient game of throwing the discus, which was such a favorite amusement with the Greeks and Romans. The discus was a circular plate of stone or metal, ten or twelve inches in diameter, which was held by its farther edge with the right hand, so as to rest upon the forearm, and was cast with a swing of the arm, aided by a twist of the whole body. It was, like the quoit, thrown edge foremost, and at an upward angle of 45°, so as to give it as great a range as possible, and he who threw it farthest was the winner. The quoit differs from this in its being thrown at a hob, and being hollow, so that it may "ring" the hob. To facilitate the striking of the quoits a flat circle of clay, which is kept moist, is usually placed round each hob.

quŏr'-ŭm, *s.* [Lat. = of whom; genit. pl. of *qui* = who. The word comes from the form of commissions written in Latin, in which, after mentioning certain persons generally, some one or more were specified in such phrases as "*quorum* unum A. B. esse volumus," *of whom* (we will that A. B be one).]

1. Those justices of the peace whose presence is necessary to constitute a bench. All justices are now generally of the quorum, but formerly some justices, eminent for learning or prudence, were specially named as justices of the quorum.

"The principal conservators of the peace are the justices nominated by commission under the great seal, which appoints them all, jointly and separately, to keep the peace, and any two or more of them to inquire of and determine felonies and other misdemeanors: in which number some particular justices, or one of them, are directed to be always included, and no business to be done without their presence, the persons so named being usually called justices of the *quorum*."—*Blackstone: Comment.*, bk. i., ch. 9.

2. Such a number of officers or members of a body as is competent by law or constitution to transact business. The term signifies a specified number out of a larger number or the whole membership of any society or official body, who are entitled to act or perform general or some fixed business for the body. Thus in statutes appointing commissioners or trustees of a public work, it is usual to name a certain number of the whole body as sufficient to perform the business when the whole number fail to attend. The same is usually the case with all bodies that have business to perform, as a Quorum of the House, or of the Senate, indicating the number of members that are empowered to legislate.

I. *Ordinary Language:*

1. The act of quoting or citing.

2. A passage quoted or cited; a part of a book, &c., quoted or adduced in proof or illustration; a citation.

¶ The habit of quotation is variously indulged in by authors, by some to such an extent that their works are little more than a continuous series of citations from older authors, strung together by a thin string of comment. This practice has not been without its advantages, since by it many fragments of ancient literature have been preserved for us which otherwise would have been lost. Our only relics of certain famous authors of the past have been handed down to us in this manner. Thus, for instance, the "Attic Night," of Aulus Gellius, is highly prized for the fragments of several lost works which it contains, while one of the few extant poems of Sappho comes to us as a quotation by Longinus, the Greek philosopher and critic. In like manner Eusebius, the Christian historian, has preserved for us highly important quoted passages from the Egyptian historian, Manetho, and the Assyrian, Berosus.

"He ranged his tropes, and preach'd up patience,
Back'd his opinion with *quotations*."
Prior: Paulo Purganti.

quō war-răn'-tō, *phr.* [Lat. = by what guarantee or warrant.]

Law: A writ formerly issuing from the Qusen's Bench against any person or persons who claimed or usurped any office, franchise, or liberty, to inquire by what authority he or they supported his or their claim, in order to determine the right. It lay also in case of non-user, or long neglect of a franchise, or misuser, or abuse of it; and commanded the defendant to show by what warrant he exercised such a franchise, having never had any grant of it, or having forfeited it by neglect or abuse. The writ is now fallen into disuse, but its end is obtained by the Attorney-general filing an information in the nature of a *quo warranto*. A similar change has taken place in the United States, the former writ of *quo warranto* being superseded by an *information*, which is a criminal proceeding in forms, though civil in substance. In case of the usurpation of the franchises of a municipal corporation, proceedings must be begun by the attorney-general of the state. But in the case of the election of a corporate officer, the writ may be issued at the instance of the attorney-general or of any person interested. In various states it has been held that *quo warranto* proceedings may be instituted against sheriffs, city councillors, county treasurers, governors, probate judges, presidential electors, militia officers, &c., the defendant being bound to show a right to the office or franchise in question. There are two forms of judgment. Against officials or individuals it is *ouster*. There being no franchise forfeited, they are simply put out of office. Against a corporation it is *ouster* and *seizure* of the corporate franchise, it being held that violation of any of the conditions of a charter works a forfeiture of the charter. This is done in case of *perversion*, where the corporation injures the public by an act inconsistant with the terms of the charter, and in case of *usurpation*, where it performs acts which it has no right to exercise. Corporations are creatures of the Legislature, and on dissolution their franchises revert to the state; these may, however, be granted anew to the old corporators or to others.

q.v., *abbrev.* [See def.] For Lat. *quod vide* = which see. It refers a reader to the word which it immediately follows.

R.

R, the eighteenth letter and the fourteenth consonant of the English language, is classed as a semi-vowel and a liquid. It is also called a trill. It is generally considered to have two sounds: the first, when it begins a word or syllable, and when it is preceded by a consonant, being then produced by an expulsion of vocalized breath, the tongue almost touching the palate or gum near the front teeth, with a greater or less tremulous motion, as in *ran, tree, morose*, &c.; the second, less decidedly consonantal, heard at the end of words and syllables, and when it is followed by a consonant, being formed by a vibration of the lower part of the tongue, near the root, against the soft palate, as in *her, star, beard*, &c. With many English speakers *r* when followed by a consonant at the end of a syllable is scarcely heard as a separate distinct sound, but has merely the effect of lengthening the preceding vowel, becoming in such cases a vowel rather than a consonant. In Scotch, and some dialects, *r* has always the same sound, being uttered with a strong vibration of the tongue, but less guttural than in French or German. By the Romans *r* was called the "dogs' letter" (*litera canina*), from its sound resembling the snarling of dogs. In words derived from the Greek we follow the custom of the Romans, who represented the aspirated sound with which *r* was pronounced by the Greeks, by *rh*, as in *rhapsody, rhetoric*, &c. In such words, however, the *h* has no influence on the pronunciation of the English word, and is, therefore, entirely superfluous. *R* and *l* are frequently interchanged (see remarks under *L*). They also sometimes change places. *R* sometimes represents a more original *s*, as in *ear* = Goth. *auso; iron* = O Eng. *isen, iren* = Goth. *eisarn*. It has disappeared from some words, as *speak* = A.S. *sprœcan; pin* = A.S. *preon; palsy* = Mid. Eng. *parlesie*, Fr. *paralysie*, Gr. *παράλυσις* (*paralusis*); *cockade* = O.Fr. *cocart*, &c. *R* has intruded itself into several words to which it does not properly belong, as *groom* (bridegroom) = A.S. *guma; hoarse* = A.S. *hós; partridge* = Fr. *perdrix*, Lat. *perdix; cartridge* = Fr. *cartouche; culprit*, from Lat. *culpa; corporal* = Fr. *caporal*. In *celery* it represents an original *n*, Gr. *σέλινον* (*selinon*).

"[*R*] that's the dog's name; *R* is for the dog."
Shakesp.: Romeo & Juliet, ii. 4.

I. *As an initial: R.* represents the Latin *rex* = king, as George R. = George, king; or *regina* = queen, as Victoria R. = Victoria, queen. It also represents English *royal*, as *R.N.* = Royal Navy, *R.A.* = Royal Artillery. In astronomy it stands for *right*, as *R.A.* = Right Ascension; in proper names, for Richard, Robert, &c.; in monumental inscriptions, for *requiescat*, as R.I.P. = *requiescat in pace* = may he (or she) rest in peace. In the navy and mercantile marine, it stands for *run* (*i.e.*, deserted) when placed after the name of an officer or seaman.

II. *As a symbol: R* was formerly used to stand for 80, and with a dash over it, $\bar{R}$, for 80,000. In medicine, ℞ stands for Lat. *recipe* = take. [Recipe.]

¶ *The three R's:* A humorous and familiar designation for the three elementary subjects of education: reading, writing, and arithmetic. It originated with Sir W. Curtis.

Jewish Hist. & Lit.: Rabbi (Heb. רַבִּי Gr. Ῥαββί) is the noun *Rab* (רַב) with the pronominal suffix, and in Biblical Hebrew = a great man, distinguished for age, rank, office, or skill (Job xxxii. 9; Dan. i. 3; Prov. xxvi. 10), where, however, it only occurs without the suffix. In post-Biblical Hebrew it is used as a title indicating sundry degrees by its several terminations. Thus, the simple term Rab (רַב) = teacher, master, and was the title which Babylonian Jews gave a doctor of the Law. Rabbi (= my master), which is the same, with the pronominal suffix first person singular, is the Palestinian title, and is the one so frequently given to Christ (cf. Matt. xxiii. 7, 8; xxvi. 25, 49, &c.). Rabbon (רַבּוֹן), which is the same term, with the pronominal suffix first person plural (= our teacher, our master), is the Aramaic form of it, and is the highest degree. This form, however, is also used as a noun absolute, the plural of which is *Rabbonin* and *Rabbonim* (רַבָּנִין רַבָּנִים). *Rabboni* (Ῥαββονί = our master, the title given to Christ in Mark, which is spelled *Rabbouni* (Ῥαββουνί) in John xx. 16, is the form of the title with the suffix first person plural. This title was conferred when three authorised Rabbins called a student Rabbi, which invested him with the right to administer the penal law. The title is first found applied after the time of Herod, subsequently to the disputes between the two schools of Shammai and Hillel. The title Rabban (our master) was first given to Gamaliel, grandson of Hillel, and president of the Sanhedrim, and was only

borne by seven other exalted chiefs of schools. At present the degree of *Morena* (our teacher) bestowed upon a candidate, as evidence of his erudition in the written and oral law, makes him eligible to the post of Rabbi, though the title carries no authority with it except on a few points of ritualistic observance. The Rabbi of to-day simply teaches the young, delivers sermons, assists at marriages, and the like, and has the power to decide some ritual questions.

"Among the gravest *rabbies*, disputant."
Milton: P. R., iv. 218.

I. *Lit. & Zool: Lepus cuniculus*, a well-known burrowing rodent, with a very wide geographical range. It probably had its home in the western portion of the Mediterranean basin, but has spread over western Europe, Britain, and Ireland. It has been introduced into Australia and New Zealand, and has multiplied there to such an extent as to become a positive pest, so that ferrets have been imported and poison made use of to keep the number down. The rabbits introduced from Spain into Porto Santo, an island near Madeira, in the early part of the fifteenth century increased in a like manner, and actually caused the abandonment of the settlement; bnt they have degenerated in respect to size, and their limb-bones bear to those of an ordinary English wild-rabbit the proportion of 5 to 9. (*Darwin: Animals & Plants* (ed. 1868), i. 113.) The rabbit is smaller than the hare (q.v.); its muzzle is slenderer, and the palate larger and narrower. The ears and feet are shorter, the former with a smaller black tip (in some cases it is entirely absent), and the general colour is grayer. They begin to breed at six months old, and have several litters in each year. The young—usually from five to eight in number—are born blind and naked, and are produced in a separate burrow. Domesticated rabbits have been greatly modified by the skill of the breeder; they have increased in size and vary in colour, albinoes being very common, and forming a separate race. Rabbits form an important article of food. During the winter from 100 to 200 tons are imported into England weekly from Ostend, whither they are sent by the Belgian peasants who breed them in hutches. Their flesh, prepared and tinned, is imported from Australia. Recently the open hutch or Morant system of rabbit-breeding has been introduced. The rabbits are confined in large hutches, the floor of which is formed of coarse galvanized wire, through which they feed on the succulent grass, the hutches being moved from place to place when necessary.

Zool.: A term introduced by Cuvier, in 1812, for the lowest of his great groups or *embranchements*. He described them as having radial, instead of bilateral, symmetry, apparently destitute of nervous system and sense organs, having the circulatory system rudimentary or absent, and respiratory organs on or co-extensive with the surface of the body; and included the Echinodermata, Acalepha, Entozoa, Polypi, and Infusoria. Wider knowledge led to the narrowing of the limits of this group, and though Agassiz (*Classification*, p. 294) pleaded for its retention (with the three classes of Polypi, Acalephæ, and the Echinoderms), Huxley's *Lectures on Comparative Anatomy* finally broke up what he called the "radiate mob" (p. 86), and distributed its constituents among the Echinodermata, Polyzoa, Vermes, Cœlenterata, and Protozoa.

2. Emission and diffusion from a central point in every direction.

II. Physics: The transmission of heat, light, or actinic power (hence known as forms of "radiant energy"), from one body to another without raising the temperature of the intervening medium. It takes place in all directions around a body. In a homogeneous medium it takes place in straight lines. Radiation proceeds *in vacuo* as well as through air. Its intensity is proportioned to the temperature of the source, and it diminishes according to the obliquity of the rays with respect to the radiaut surface, and the radiating or emissive power of a body, or its capability of emitting at the same temperature, and with the same extent of surface, greater or less quantities of heat. The energy received from a radiating body is inversely proportional to the square of the distance; and the radiation of a body is exactly proportional to its absorbing power. If the radiating power of lampblack be reckoned at 100, that of platinum foil is 10·80; copper foil, 4·90; gold leaf, 4·28, and pure laminated silver 3·80.

¶ Solar radiation is the radiation from the sun; terrestrial radiation that from the earth into space.

Nat. Science: (See extract).

"On the 23rd of March, 1875, in the Pacific, in lat. 11° 24′ N., long. 143° 16′ E., between the Caroline and the Ladrone groups, we sounded in 4,575 fathoms. The bottom was such as would naturally have been marked on the chart from its general appearance 'red clay;' it was a fine deposit, reddish-brown in colour, and it contained scarcely a trace of lime. It was somewhat different, however, from ordinary 'red clay'—more gritty; and the lower part of the contents of the sounding-tube seemed to have been compacted into a somewhat coherent cake, as if already a stage towards hardening into stone. When placed under the microscope, it was found to contain so large a proportion of the tests of radiolarians that Mr. Murray proposed for it the name *radiolarian-ooze.*"—*Thomson: Voyage of Challenger,* i. 230, 231.

rā-dĭ-ŏm'-ĕ-tĕr, *s.* [Lat. *radius* = a ray, and Eng. *meter* (q.v.).]

1. An instrument for taking the altitudes of the celestial bodies.

2. An instrument invented by Crookes for measuring the mechanical effect of radiant energy, and exhibited by him at the Royal Society, April 7, 1875. It resembles a miniature anemometer, and is made to revolve by the action of light. The cups of the anemometer are replaced by discs, coloured white on one side and black on the other, and the instrument is inclosed in a glass globe from which air has been exhausted, so that no heat is transmitted. When the discs are exposed to light, revolution begins immediately, and its speed is governed by the intensity of the light. Two candles produce twice the effect of one, and the flame of magnesium wire makes the discs spin round with great rapidity.

ragged-schools, *s. pl.* A name applied in recent times in Britain to institutions founded for the moral reclamation and Christian instruction of the juvenile and adult necessitous poor. The initiatory movement of Raikes at Gloucester was virtually a ragged-school crusade; but, more strictly, the earliest pioneers were T. Cranfield, who inaugurated the work in South London in 1810; John Pounds, who gathered a large class at Portsmouth, and died in 1839; and, in Scotland, Dr. Guthrie (1805–73). Soon after the close of the great European wars, ragged-

school operations among orphan and neglected children on the Continent were inaugurated by John Falk at Weimar and Baron Kottwitz at Berlin. In London the movement received a powerful stimulus by the institution of the Ragged-school Union in 1844, under the leadership of Lord Ashley (afterwards seventh Earl of Shaftesbury). John Pounds, the virtual founder of the movement, was a poor shoemaker of Portsmouth, who for twenty years before his death gathered the ragged children of his district around him as he sat at work, and taught them gratuitously. His humble efforts were so successful as to induce more influential persons to engage in the work, principal among them Dr. Guthrie, whose famous "Plea for Ragged Schools" gained for its author the credit of being the father of the system. At present there is scarcely a town of any importance in Britain that has not one or more Ragged Schools. Ragged Schools have not extended to the United States, there being no need of them here, though the class of children represented are being cared for in various ways.

rāil'-rōad, *s.* [Eng. *rail* (3), s., and *road.*] (The Railroad of the United States is termed Railway in England. The street railway of the United States is the tramway of England.)

A way or road provided with rails of iron or steel, upon which the wheels of the carriages run in order to lessen the friction. The "rails" were originally of timber, laid straight and parallel upon transverse sleepers, and secured with pegs of wood, the sleepers being imbedded in the material of the roadway; the wheels of the wagons had flanges on one side of the periphery, to confine them to the track. The roadway was scantling, five by seven, pegged down to oak sleepers, four by eight, six feet long, and laid two and a half feet apart. The track for the horses was filled in with ashes above the sleepers. Such roads (tramways) were first laid down by Mr. Beaumont at Newcastle, England, in 1602. About 1716, the wooden ways were capped with thin plates of malleable iron, having flanges along one side. Cast-iron bars were substituted in 1767. The modern railroad consists of one or more series of iron or steel rails [RAIL (3), *s.*, II. 3.], laid parallel and continuously at a certain distance or width from each other, called the gauge. [GAUGE, *s.*, II. 7.] The wooden tramways of the collieries, before the invention of the iron rail, had a gauge of four feet. One pair of parallel rails constitutes a single line of railroad, two pairs a double line. A railroad, as a general rule, is carried in as straight a line from point to point as the nature of the country and the necessities of local and intermediate traffic will allow. It is carried over valleys by embankments or viaducts, over rivers and roads by bridges, and through hills or elevated ground by deep trenches, technically called cuttings, or by tunnels. [CUTTING, C. II. 2; PROFILE, *s.*, II. 3 (2).] Spoil is surplus material, left over and deposited in a spoil-bank, when the amount excavated exceeds that required for embanking. When the material excavated is insufficient for the embankments, recourse is had to side cuttings, that is to widening the cuttings, so as to obtain extra material to supply the deficiency. A perfect railroad would be one laid on a level line, but as this is not always possible owing to the inequalities in the country traversed, or the difference of levels of the places to be connected, the line follows the level of the country traversed, rising and falling according to circumstances. These slopes or inclines of the line are called its gradients, and the whole arrangement of inclines is called the grading of the line. The way or track of the railroad is laid with clean gravel or broken stones, called ballast, and in this the sleepers are laid either transversely or longitudinally, the former arrangement being the more usual. [SLEEPER.] The rails are, in most instances, supported at short intervals by cast-iron frames, called chairs, which are fastened firmly by spikes to the sleepers, and in which the rails are firmly secured by wooden blocks, called keys. [CHAIR, *s.*, A. II. 4; KEY, (3), *s.*, II. 6.] Where flange-rails are used there are no chairs, the rails being attached direct to the sleepers. Transverse sleepers are laid at a distance of from two feet six inches to three feet from centre to centre. The rails are joined at their extremities generally by fish-joints (q.v.). In order to allow trains of freight or passenger cars to pass each other, or to pass from one line to another, sidings and junctions are constructed. Sidings are generally used for cars or trains to remain on temporarily while being loaded or unloaded, or while another train is allowed to pass on the line of rails on which the first train is proceeding. The change from one line of rails to another at a junction is effected by means of points or switches (q.v.), and the process of turning a train into a siding or from one line to another is termed switching off, or, in England, shunting (q.v.). When a railroad is thus completed, the work is called the permanent way (q.v.). The extremities of a railroad are called its termini [TERMINUS], and the various places, provided with offices, &c., along the line where trains stop to take up or set down passengers or goods are termed stations, formerly called depots. The motive power usually employed on railroads in drawing the trains of cars is steam. Attempts have also been made to utilize atmospheric pressure as a motive power. [ATMOSPHERIC-RAILWAY.] Electrical power is now being employed.

¶ The first railroad opened was that from Stockton to Darlington, England (Sept. 25, 1825), the second in that country that from Liverpool to Manchester (Sept 15, 1830). The first railroad for freight and passenger traffic in the United States was begun by the Baltimore and Ohio Company, the first section (14 miles long) being opened in May, 1830, horse traction being at first employed. A railroad three miles long, from Quincy, Mass., to Neponset River, for freight traffic, had been previously built, also one for the use of the Delaware and Hudson Canal Co. The first locomotive in this country, the Stourbridge Lion, was imported from England in 1829. The second, The Best Friend of Charleston, was built here in 1830, for the South Carolina Railroad. In the sixty years between 1830 and 1890 167,000 miles of railroad, an average of nearly 2800 miles yearly, were constructed in the United States, a total which is far in advance of that of any other country and equal to that of all the remainder of the world, the total mileage in 1890 being about 342,000 miles.

1. *Meteor.:* The fall of water in drops from the clouds, or the drops which fall. A cloud consists of aqueous vapour, the individual vesicles of which are very small. When by the constant condensation of fresh aqueous vapour these vesicles become large and heavy, and several of them unite, they are unable to resist the action of gravity and fall as rain.

2. *Geol.:* The direct action of rain, as distinguished from its indirect one in creating streams, rivers, &c., is a potent aqueous cause. In many places, however, its effect is much diminished by the protective influence over the soil exerted by the vegetation (*Lyell: Princ.*, ch. xlv.). Penetrating into crevices of rocks, it is frozen and splits them. [Ice.] Moreover, in passing through the atmosphere, it absorbs a considerable amount of carbon dioxide, which enables it to transform the carbonate of lime in limestone rocks into the soluble bicarbonate, and ultimately waste them away; it acts also on felspar, &c.

It feeds on animal substances. Gosse says (*Birds of Jamaica*, p. 275), "I have found in various individuals, locusts, Phasmata, spiders, Phryni, a whole mouse, caterpillars, &c." It is sometimes also called Tom Fool, from its silly habit of gratifying its curiosity instead of securing its safety. One simple form consists of a copper funnel five to seven inches in diameter, inserted in the neck of a bottle placed on a stand and protected from the sun's rays, to prevent evaporation. The rain collected in the bottle is measured in a glass jar having one-tenth the area of the funnel, and graduated so that a rainfall of one-tenth of an inch collected by the funnel is measured by one inch on the side of the vessel. The stand should be placed at a sufficient distance from any buildings, &c., to prevent their affecting the amount falling into the funnel.

A. *As substantive:*

1. *Meteor.:* A luminous bow or arch appearing in the clouds opposite to the sun when they are resolved into rain. Theoretically several bows may co-exist; generally, however, there is but one. Sometimes there are two, very rarely three or even four—the largest number authentically on record. Every rainbow exhibits the prismatic colours. When there are two bows, the lower, or primary, is very bright, and has the red highest; the outer, or secondary, is more faint, and has the violet the highest colour. They are produced chiefly by the refraction and dispersion of the light in passing through the raindrops, partly also by its reflection from the back of the drops, without which the appearances would not reach the eye. The secondary bow ceases to be visible when the sun is 54° above the horizon.

2. *Ornith.:* The genus Diphlogena, containing two of the most brilliantly plumaged Humming-birds. The bill is straight and very long, the tail deeply forked. II. *Zool. :* A name popularly applied to the larger murines, but more strictly applicable to two species : (1) the English Black Rat (*Mus rattus*), and the Brown, or Norway Rat (*M. decumanus*). The former is a small, lightly-built animal, about seven inches long, with a slender head, large ears, and a thin scaly tail, longer than the body. In temperate climates the colour is a bluish-black, lighter on the belly. This species is represented in warmer climates by the Alexandrian Rat (*M. alexandrinus*, Geoff., better known as *M. rattus rufescens*, see *Proc. Zool. Soc.*, 1886, p. 57), with a gray or reddish back, and white under-surface. By later naturalists it is considered as only a variety. The albino and pied rats, kept as pets, also belong to this species, which had its home in India, and penetrated thence to almost every part of the world, driving out the native rats, and to be, in its turn, exterminated by the Brown Rat (probably a native of China, where a similar species, *M. humiliatus*, is still found). The Brown Rat is much more heavily built than the Black Rat, grayish-brown above and white beneath ; ears, feet, and tail flesh-coloured. Melanism often occurs, but such animals may be readily distinguished by ordinary specific differences from the true Black Rat. Length of head and body eight or nine inches long, tail shorter. Both the species are omnivorous, predaceous, and extremely fecund, breeding four or five times in the year, the female producing from four to ten blind, naked young, which breed in their turn at about six months old. *M. fuscipes* is the Brown-footed Rat of Australia ; *Nesokia bandicota*, the Bandicoot, or Pig-rat ; and *N. bengalensis* the Indian Field Rat. Zool.: The genus Mellivora (q.v.). Two species are usually distinguished, *Mellivora indica*, the Indian, and *M. ratel*, the Cape Ratel; some authors give specific distinction to the West African race, as *M. leuconota*. The body is stout and heavily built, legs short and strong, with long curved fossorial claws, tail short, ear-conches rudimentary. General coloration iron-gray on the upper, and black on the lower surface, reversing the general plan of coloration, which is generally lighter on the under surface. A marked white stripe divides the gray of the upper parts from the black in

the Cape Ratel, which is said to live principally on honey. Jerdon (*Mammals of India*, p. 79) says that *M. indica*, which he calls the Indian badger, is found throughout India, living usually in pairs, and eating rats, birds, frogs, white ants, and various insects; and in the north of India, where it is accused of digging out dead bodies, it is popularly knowu as the Grave-digger. It doubtless also, like its Cape congener, occasionally partakes of honey, and is often very destructive to poultry. In confinement it is quiet, and will eat fruits, rice, &c.

"The two *ratels* are so nearly allied that they might almost be considered to be merely geographical races of a single widely spread species."—*Encyc. Brit.* (ed. 9th), xx. 289.

* **I.** *Ord. Lang.:* Reason, cause.

II. *Technically:*

1. *Law:* An account; a cause, or the giving judgment therein.

2. *Mathematics:*

(1) The measure of the relation which one quantity bears to another of the same kind; that is, it is the number of times that one quantity contains another regarded as a standard. This is found by dividing the one by the other. The quotient or ratio thus obtained is the proper measure of the relation of the two quantities. Some writers define the ratio of one quantity to another, as the quotient of the first quantity divided by the second, whilst others define it as the quotient of the second divided by the first. Thus, the ratio of 2 to 4, or of a to b, may be taken either as $\frac{2}{4}$ or $\frac{4}{2}$, and $\frac{a}{b}$ or $\frac{b}{a}$. In every ratio there are two quantities compared, one of which is supposed known, and is assumed as a standard; the other is to be determined in terms of this standard. These quantities are called terms of the ratio; the first one, or that which is antecedently known, is called the antecedent, and that whose value is to be measured by the antecedent, is called the consequent. Ratios are compared by comparing the fractions: thus, the ratio of 8 : 5 is compared with the ratio of 9 : 6, by comparing the fractions $\frac{8}{5}$ and $\frac{9}{6}$; these fractions are respectively equal to $\frac{48}{30}$ and $\frac{45}{30}$, and since $\frac{48}{30}$ is greater than $\frac{45}{30}$, the ratio of 8 : 5 is greater than that of 9 : 6. Ratios are compounded together by multiplying their antcedents together for a new antecedent, and their consequents together for a new consequent; thus, the ratio of $a : b$, compouuded with that of $c : d$, is $ac : bd$. Proportion is the relation of equality subsisting between two ratios. [PROPORTION, s.]

*(2) A name sometimes given to the Rule of Three in Arithmetic.

¶ (1) *Compound ratio:*

(*a*) [COMPOUND, *a.*].

(*b*) When one quantity is connected with two others in such a manner that if the first is increased or diminished, the product of the other two is increased or diminished in the same proportion, then the first quantity is said to be in the compound ratio of the other two.

(2) *Direct ratio:* Two quantities are said to be in direct ratio when they both increase or decrease together, and in such a manuer that their ratio is constant.

(3) *Duplicate ratio:* When three quantities are in continued proportion, the first is said to have to the third the duplicate ratio of that which it has to the second, or the first is to the third, as the square of the first to the square of the second.

(4) *Inverse ratio:* Two quantities or magnitudes are said to be in inverse ratio, when if the one increases the other necessarily decreases, and, *vice versâ*, when the one decreases the other increases.

(5) *Mixed ratio:* [MIXED].

(6) *Prime and ultimate ratios:* A method of analysis, devised and first successfully employed by Newton in his *Principia*. It is an extension and simplification of the method known amongst the ancients as the method of exhaustions. To conceive the idea of this method, let us suppose two variable quantities constantly approaching each other in value, so that their ratio continually approaches 1, and at last differs from 1 by less than any assignable quantity; then is the ultimate ratio of the two quantities equal to 1. In general, when two variable quantities simultaneously approach two other quantities, which, under the same circumstances, remain fixed in value, the ultimate ratio of the variable quantities is the same as the ratio of the quautities whose values remain fixed. They are called prime, or ultimate ratios, according as the ratio of the variable quantities is receding from or approaching to the ratio of the limits. This method of analysis is generally called the methods of limits.

(7) *Extreme and mean ratio:* [EXTREME].

(8) *Composition of ratios:* The act of compounding ratios. [COMPOUND-RATIO.]

(9) *Ratio of a geometrical progression:* The constaut quantity by which each term is multiplied to produce the succeeding one. To find the ratio of a giveu progression, divide any term by the preceding one.

(10) *Ratio of exchange:* A phrase used in Political Economy to deuote the proportion in whieh a quantity of one commodity exchanges for a given quantity of another. Such ratios, of course, can be expressed only in figures, the numerals being associated with such expressions of measurement as may be currently in vogue. Thus, with wheat at $1.00 per bushel, the ratio of exchange between wheat in bushels and money in dollars, is 1 : 1; and to money in cents, is 1 : 100. Ratios of exchange deal wholly with quauntities, and can be expressed numerically, but not measured. [See VALUE, *s.*]

rā'-tion-ąl-ĭşm, *s.* [Fr. *rationalisme.*]

Theol.: A system which makes reason the supreme arbiter in all matters connected with the Bible and the Christian religion, and which refuses to accept any doctrine or professedly historical statement to which reason believes that it has grounds for taking exception. Isolated cases of rationalism, or an approach to it, have frequently appeared in the Church: as, for instance, in the case of Theodore, Bishop of Mopsuestia, 329–428; but as a system it first became prominent in Germany in the latter half of the eighteenth century. In 1754 Hermann Reimarus of Hamburg privately circulated among his friends some rationalistic writings of his. Lessing pretended that he had found them in the Wolfenbüttel library, of which he was librarian, and between 1773 and 1777 published them under the name of the Wolfenbüttel Fragments. They produced a great sensation. John David Michaelis (1717–1791), Johann Semler (1728–1794), and others established a middle path between the extreme views of the Fragmentists and the accepted Protestant orthodoxy, and it was to this intermediate school that the term rationalistic was chiefly applied. The earlier rationalists in large measure confined their new methods of interpretation to the Old Testament; Johann Eichorn (1752–1827) and Heinrich Paulus (1761–1850) extended them to the New. As time advanced, rationalism became more extreme. Its earlier professors generally, accepting the views as to the authorship of the several sacred books traditionally held, considered that they, when rightly understood, narrated true history, but their oriental or poetic language required to be translated into that of ordiuary life. For instance, the angel and the flaming sword which prevented our first parents from re-entering paradise really meant the thunderstorms prevalent in the region. The later rationalists mostly deny the accepted authorship of the sacred books, and more sweepingly than their predecessors set their teaching aside. In 1835–6 Dr. David Strauss, in his *Leben Jesu*, resolved the whole evangelical narrative into myth and legend. Rationalism subsequently spread from Germany into other countries. In 1860 appeared the *Essays and Reviews*, by seven clergymen of the English Church, and in 1862 the first part of a *Critical Commentary* on the Pentateuch and the Book of Joshua by Dr. William Colenso, Bishop of Natal, five other parts subsequently appearing. Both these productions led to ecclesiastical prosecutions. In 1863 Ernest Renan published in Paris his *Vie de Jésus.* Since then numerous works of rationalistic tendency have been published, alike in the United States and Europe, and rationalistic views are becoming somewhat widely disseminated. Though combating the claims of the sacred writers, as a rule, rationalists of all schools speak with respect of them.

2. *Zool.:* An organ developed in the genus Crotalus. The tail terminates in a series of horny rings, varying in number with the age of the individual, as one is added at each sloughing, which occurs more than once in the year. The last (3-8) vertebræ coalesce to form a compressed conical bone, covered by muscle, and thick spongy skin, which secretes the rings in succession, each one being larger than the one secreted before it, as the secreting surface becomes larger. The pieces hang loosely, but securely, together, the basal ring of one joint grasping the projecting second ring of the preceding joint, and so on. The first joint alone has vital connection with the skin of the animal, and, being vibrated by the muscles of the skin, communicates a quivering motion, accompanied by a slight rattling sound, to the dry horny pieces behind it.

"The habit of violently agitating the tail is by no means peculiar to the rattlesnake, but has been observed in other venomous as well as innocuous snakes, with the ordinary termination of the tail, when under the influence of fear or anger. The special object for which the *rattle* has been developed in these snakes is unknown."—*Encyc. Brit.* (ed. 9th), xx. 293.

Zool.: The English name for any species of the American genus Crotalus (q.v.), the tail of which is furnished with a rattle [RATTLE, *s.*, II. 2.]. Garman (*Reptiles & Batrachians of North America*) enumerates twelve species and thirteen varieties, falling into two groups: (1) Having the upper side of the head covered with nine dermal shields; (2) Having the shields behind the eyes broken up or replaced by small scales. The second group comprises the more formidable kinds, generally described as *Crotalus horridus* and *C. durissus.* The first name was formerly applied to the reptile extending from Paraguay and Chili, through Brazil, into Mexico, and the latter to the North American rattlesnake. In recent American works this nomenclature is reversed. The poison of the Rattlesnake is usually fatal to man, though fortunately they are sluggish, and never attempt to strike unless they are molested. They are widely distributed on the American continent; but advancing cultivation is rapidly thinning their numbers, and the half-wild hogs of the settlers, peccaries, and deer contribute materially to this result. They are far from uniform in coloration: often the ground-colour is brownish, sometimes yellow or blackish, with dark spots, frequently bordered with yellow, on the back and sides; head and neck ornamented with dark or black longitudinal bands, or of almost uniform coloration.

A. *As substantive:*

Ornith.: The genus Corvus, and especially *Corvus corax*, the largest of the European, and one of the largest of all the Passerines. It is about twenty-six inches long, plumage black, glossed with steel-blue and purple; very widely distributed in the northern hemisphere, but becoming somewhat rare from the persecution to which it is subject at the hands of gamekeepers and farmers, on account of its predatory habits, for it preys extensively on young game, chickens, and ducklings. It extends through northern Asia and America, but is generally replaced by the crow in the United States. Cases of partial or total albinism often occur. White ravens were known to Aristotle, who attributed the want of colour to the season of the year, and the cold weather. Pied varieties of the Raven have been treated as constituting a distinct species (*Corvus leucophæus*, Vieillot). They occur most frequently in the Ferro Islands, and are generally the offspring of normally black parents. The Raven has played an important part in mythology and folk-lore. It is the first bird mentioned by name in the Old Testament (Gen. viii. 7); by the ministry of ravens Elijah was fed (1 Kings xvii. 6), and they were to be the ministers of vengeance on unruly children (Prov. xxx. 17). The raven was the bird of Odin, and in classic mythology was of ill-omen, a character often attributed to it by the early English dramatists. Marlowe (*Jew of Malta*, ii. 1) calls it the "sad presageful raven," and Shakespeare repeatedly refers to the belief that its appearance foreboded misfortune. This belief, which is widespread, probably arose from the preternaturally grave manner of the bird, its sable plumage, and the readiness with which it learns to imitate human speech.

¶ Properly speaking, the reaping-hook (represented B.C. 1490 in a harvest scene on a tomb at Thebes, and still in use) and the scythe are reaping-machines; but the term is generally confined to the modern machines in which operations formerly carried on by the human hand are effected by machinery. In 1786, Pott, an Englishman, made a machine which had a revolving cylinder, with rows of combs or ripples, which tore off the ears and discharged them into a box (as had been done in Gaul A.D. 70). Six or seven other machines followed in England within the next thirty-six years. In 1822 a self-sharpening mowing machine was patented in the United States. In 1827, the Rev. Patrick Bell invented a reaping-machine, tried at Powrie, in Forfar, and revived at the Great Exhibition of 1851. It cut about an acre an hour. In 1852, after a competitive trial held in Forfarshire, it was adjudged to be the best then known. Between 1852 and 1874 nearly three thousand patents for reaping machines were taken out in the United States. Two of the most celebrated are M'Cormick's, invented about 1831, and improved in 1846, and Wood's reaping and automatic binding machine, first used in 1874. At a competition between three reaping machines, held near Paris, in 1855, the American machine cut an acre in twenty-two minutes, the English in sixty-six minutes, and the Algerian in seventy-two minutes.

A. *As substantive:*

I. *Ordinary Language:*

1. In the same sense as II. 3.

"The word *reason* itself is far from being precise in its meauing. In common and popular discourse it denotes that power by which we distinguish truth from falsehood, and right from wrong, and by which we are enabled to combine means for the attainment of particular euds."—*Stewart: Of the Human Mind.*

2. Due exercise of the reasoning faculty; reasoning; ratiocination; the deduction of consequences from premises; right judgment.

Davies: Immortality of the Soul.

3. That which is in accordance with or conformable to right judgment or the principles of the reasoning faculty.

1. *Hist.:* On November 10, 1793, the French National Convention ordered the worship of the Goddess of Reason. Madame Maillard, selected as such a goddess, was drawn on a splendid car to the cathedral of Notre Dame to receive homage from the multitude. For some time afterwards that cathedral was designated the Temple of Reason.

2. *Logic:* The premise or premises of an argument, and especially the minor premise.

3. *Metaph.:* The power of thinking consecutively; the power of passing in mental review all the facts and principles bearing on a subject, and, after carefully considering their bearings, drawing conclusions in many cases conformable with truth. Reason, weighing facts, discovered the law of gravitation, calculates eclipses, weighs the planets, ascertains the constituent elements of the sun, and even of more distant worlds. It can exercise itself on the most abstract and spiritual theories, as well as on those of a simpler character. Reid (Essay vi., ch. iii.) distinguished between reasou and judgment, considering the sphere of the former to be propositions capable of demonstration. Stewart (*Philosophy Human Mind,* pt. ii., Prelim. Observ.) considered the word reason as ambiguous. In common discourse it denotes the power of discriminating truth from falsehood, and right from wrong. To these he adds the power of devising means to accomplish ends; or reason may be limited to the power of distinguishing truth from falsehood; or it may be used of our rational power in general, or of the discursive faculty alone. Brown (*Phil. Hum. Mind.*, lect. li.) thinks that there is no faculty of reason, which is nothing more than a series of relative suggestions. Immanuel Kant's *Critique of Pure Reason* appeared 1781. [KANTIAN PHILOSOPHY.] Mill (*Logic*, bk. i., ch. i.) considers reasoning in its extended sense to be synonymous with inference, and divides it into induction, *i.e.*, reasoning from particulars to generals, and ratiocination, reasoning from generals to particulars. Formerly it was believed that of the whole visible creation man alone was capable of reasoning; but Darwin (*Descent of Man,* pt. i., ch. iii.) considers that only a few persons now dispute that animals possess some power of reason. Their actions may be due to instinct, or to the association of ideas, the last named principle being connected with reason.

Scrip. Zool.: Bos primigenius. In the A. V. the influence of the Septuagint has prevailed, and the word is translated unicorn, but erroneously as the mention of two horns on one reem (Deut. xxxiii. 17) proves. The word unicorn has disappeared from the R. V., wild ox being substituted for it; but in Numb. xxiii. 22, the alternative rendering ox-antelope (*Oryx leucoryx*) is given in the margin. Young (*Paraphrase of Job,* 241) transliterates the Hebrew word. [Aurochs.]

"The identification of the Hebrew *reêm* with the wild ox (*Bos primigenius*) is one of the most certain of all Bible animal names. It rests on philological evidence, for the Assyrian *rimu* clearly denotes this same wild bovine; on pictorial evidence, for the Assyrian monuments depict it admirably; on palæontological evidence, for the bone breccia of the Lebanon has revealed the teeth of this once common wild ox of Palestine and the adjacent countries; on historical evidence as a definite inhabitant of Palestine, for a hunting record of Tiglath-Pileser I. informs us that this monarch slew some of these wild *rimu* in the country of the Hittites and at the foot of Lebanon, the exact spot where its teeth have been discovered; on ideographic evidence, for the Accadian character is a pictorial or hieroglyphic figure of an ox's head, while all the references in the Bible are exactly suited to this large and fierce wild ox."—*W. II. *Optics:*

1. A device by which the rays proceeding from a luminous or heated object are thrown back or diverted in a given direction. The reflecting surface may he either plane or curved. In practice it is often made spherical or parabolic. The former does not bring the rays to a true focus, but is easily formed, and is consequently generally employed where extreme accuracy is not sought for. A mirror is a familiar example of a plane reflector. The material should be as smooth and highly polished as possible. Sheet-tin is frequently used for common purposes, as for door or hall lamps, or those carried by vehicles, while for other purposes a more perfectly reflecting surface is employed, such as speculum metal or silver protected by glass. Silver is the most perfectly reflecting substance known, absorbing but 9 per cent. of the incident rays, while speculum metal absorbs 37 per cent. Glass itself, owing to its property of totally reflecting incident rays at a low angle, is used in certain cases. Reflectors with parabolic surfaces are employed for throwing the light emanating from objects placed in their foci in parallel straight lines to a great distance, and for converging the heat rays from a distant object, as the sun, to a focus, and also, in connection with eye-glasses, in the reflecting-telescope, which is itself often simply denominated a reflector.

¶ The term mirror is less comprehensive than that of reflector, being usually only applied to such surfaces as afford definite images and colours, while a reflector may not merely be used for throwing back the rays of light and heat, or of heat only, but also the waves of sound.

2. The same as REFLECTING-TELESCOPE (q.v.).

Reform-Acts, *s. pl.*

English Legislation: A term applied to certain acts of parliameut by which the parliamentary representation of the people was altered, and especially to those of 1832, 1867, and 1884–85. The first two Acts provided both for an extension of the franchise (Franchise) and for a redistribution of seats. The Reform Act of 1832 disfranchised fifty-six rotten boroughs with less than 2,000 inhabitants each, and returning 111. members; thirty boroughs with less than 4,000 inhabitants, and two above that number, lost each a member, and thus 143 seats were obtained for distribution. Forty-three new boroughs were created, twenty-two of which received two members each, and twenty-one one member each. The county members for England and Wales were increased from ninety-five to 159, twenty-six of the large counties being divided, and a third member given to seven important county constituencies. Scotch and Irish Acts followed; the Scotch representation, fixed by the Act of Union at forty-five, was raised to fifty-three (thirty of them given to counties and twenty-three to cities and boroughs), and the Irish members, fixed by the Act of Union at 100, were increased to 105. The Reform Act of 1867 disfranchised eleven small English boroughs, took a member from thirty-five more, and two from Scotch counties, which, with four seats obtained from boroughs disfranchised for corruption, gave fifty-two seats for redistribution. Five of these were given to as many large English and Scotch boroughs on the three-cornered system (q.v.), and three to Universities, the others to old or new county or borough divisions. Seven members were added to Scotland. There was no redistribution in Ireland. In the third successful effort for Parliamentary Reform, that of 1884–85, the franchise and redistribution of seats constituted two distinct Acts. The Franchise Bill received the royal assent on December 6, 1884, and came into operation on January 1, 1885. It established household and lodger franchise in the counties, introduced a service-franchise (q.v.), diminished, though it did not destroy, faggot voting, and made a uniform occupation franchise of £10 rent both in counties and in boroughs in place of the three formerly existing. It left untouched the forty-shilling freeholders of inheritance, and conferred votes on copyholders possessing land of greater value than £5 annually. By the Redistribution Act of 1885, eighty-one English, two Scotch, and twenty-two Irish boroughs were totally disfranchised; thirty-six English and three Irish boroughs each lost a member, as did two English counties; the City of London was reduced from four to two; six seats were obtained from places disfranchised for corruption, and the members of the House of Commons were increased by twelve. The seats thus obtained for redistribution were 180. The great feature of the scheme which followed (agreed to after a conference between the two great political parties) was the separation of populous boroughs and counties into divisions, each returning a single member. Only a few places hitherto with two members were left with the old arrangement. England has now (1886) 465 members, Wales 30, Scotland 72, and Ireland 103, the reduction from 105 occurring through the disfranchisement of Sligo and Cashel some years ago for corruption. (*W. A. ¶ *The Reformation:*

Hist: The great revolt against the tenets

and the domination of the mediæval church which took place in Western Europe in the sixteenth century. The Church of the middle ages had possessed an amount of power never before or since reached by any other ecclesiastical organization. It attained the height of its glory in the thirteenth century, and by the fourteenth had begun to decline. In that century arose Wycliffe (1324(?)–1384), "the Morning Star of the Reformation." [LOLLARD, LOLLARDISM.] There is an historical connection between his labours and the Hussite movement. [HUSSITE.] Meanwhile, the revival of letters, the invention of printing, the discovery of America (1492), and the Cape route to India (1497), enlarged men's conceptions, and prepared them for novelties in religion. In the sixteenth century, the decisive struggle began, independently, in France in 1512, under James Lefevre of Etaples, in Switzerland in 1516, under Ulrich Zuinglius, and in Germany in 1517. The French movement in large measure failed [HUGUENOT], and of the other two, that in Germany was so much the more potent, that from its commencement (October 31, 1517) dates the period of the Reformation and of modern times. [LUTHERAN, PROTESTANT.] (For the Swiss Reformation see Reformed Church; for that of England, Church of England; for that of Scotland, Church of Scotland.) Though the most potent influence in the Reformation was a strong spiritual impulse, yet other elements had a large place. The ethnologist observes that, speaking broadly, the Teutonic race in England, Scotland, Germany, Switzerland, Holland, Sweden, Norway, and Denmark, embraced the Reformation, while the Latin and Celtic races rejected it, the chief exception being that Teutonic Austria remained Catholic, while the Celtic Scottish Highlanders became Protestant. The intellectual impulse which the Reformation communicated is still in full force, and will never fade away.

Reformed Church, *s.*

Church Hist.: The name given first to the Helvetic Church, which rejected both transubstantiation and consubstantiation, regarding the communion as simply a commemorative ordinance. [LORD'S SUPPER.] Afterwards, the name Reformed Churches was extended to all other religious bodies who held similar sacramental views. The founder of the Helvetic Church was Ulrich Zwingli, who began to preach reformed doctrines in 1516, and in 1519 engaged in a contest with Samson, a seller of indulgences. D'Aubigné (*Hist. Ref.*, bk. xv.), himself a Swiss, shows that from 1519 to 1526 Zurich was the centre of the Swiss Reformation, which was then entirely German, and was propagated in the eastern and northern parts of the Helvetic Confederation. Between 1526 and 1532 the movement was communicated from Berne; it was at once German and French, and extended to the centre of Switzerland from the gorges of the Jura to the deepest valleys of the Alps. In 1532 Geneva took the lead. Here the Reformation was essentially French. The first or German part of the movement was conducted by Zwingli, till his death at the battle of Cappel (Oct. 11, 1531), the second by various reformers, the third part by William Farel, and then by John Calvin. [CALVINIST.] During the last and the present century rationalism has extensively pervaded the Swiss Church.

* **rĕ-frăc'-tą-rў,** *a.* & *s.* [REFRACTORY.]

rĕ-frăct'-ĕd, *pa. par.* & *a.* [REFRACT.]

A. *As pa. par.:* (See the verb).

B. *As adjective:*

1. *Bot. & Zool.:* Bent back at an acute angle; bent suddenly, as if broken. (*Martyn*, &c.)

2. *Physics:* Turned or deflected from a direct course, as a ray of light or heat.

rĕ-frăct'-ĭng, *pr. par.* or *a.* [REFRACT.]

¶ *Refracting angle of a prism:* The angle formed by the two faces of the triangular prism, used to decompose white or solar light.

refracting-dial, *s.* A dial in which the hour is shown by means of some transparent refracting fluid.

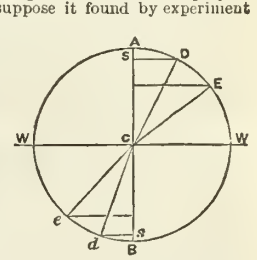
refracting-surface, *s.* A surface bounding two transparent media, at which a ray of light in passing from one into the other undergoes refraction.

refracting-teleseope, *s.* The ordinary form of telescope (q.v.).

rĕ-frăc'-tion, *s.* [Fr., from Lat. *refractus*, pa. par. of *refringo* = to break up; Sp. *refraccion*; Ital. *rifrazione.*] [REFRACT.]

* 1. *Ord. Lang.:* The act of bending back; the state of heing refracted or hent back.

2. *Physics:* The bending or deflection of a ray of light (including heat and all other forms of radiaut energy) which takes place whenever the ray passes at any other angle than a right angle from the surface of one medium into another medium of different density. This optical density hy no means coincides with comparative specific gravity, *e.g.*, turpentine is optically denser than water, but floats on the top of it. It is a retarding influence; and accordingly when the ray enters the denser medium at right angles, though not refracted, it is retarded in a certain proportion, traversing a less distance in a given time. Rays at other angles, it can he shown hy analysis, must be bent aside according to a law discovered by Snell about A.D. 1620. Let W W represent the refracting surface of the denser medium, for example of water; and draw A B perpendicular to that surface. Describe a circle round the point C, where the perpendicular cuts the surface. Now let a ray D C enter the surface at C, at some angle A C D with the perpendicular, and suppose it found by experiment that the refracted ray takes the direction C *d*. In the first place, the refracted ray will be found to be in the same plane as the incident ray. In the second place, if the medium helow W W he the denser,



the refracted ray will be bent towards the perpendicular, and the reverse in the contrary case, so that a ray *d* C incident in water would he refracted as C D, further away from the perpendicular, on emergence into air. But thirdly, the refracted course of every other ray can now be calculated, according to the following (Snell's) law. Draw D S and *d s* normal to the perpendicular, then the lines D S and *d s* will represent geometrically the sines of the arcs A D and *d* B, and if the radius C A he unity, the numbers expressing S D and *d s* will be the sines of the angles. The sine S D will have a certain ratio to the sine *d s*. And now if any other incident ray, E C, bc taken, its sine found in the same way will be found to bear the same ratio to the sine of the refracted ray. This ratio of the sines is therefore invariable for all incidences for the same homogeneous substance. Such ratio is called its refractive index. And it will be readily seen how, the index of any substance—as some kind of optical glass—being once found by some simple experiment, the course of every refracted ray incident at any angle on the curved surface of a lens can be foreseen, and thus its focus and other properties calculated, or the curves calculated for a given focus, which is simply the point to which refracted rays converge.

¶ (1) *Astronomical, atmospheric,* or *celestial refraction:*

Astron., &c.: The alteration of the direction of a luminous ray proceeding from a heavenly body to the eye of a spectator on the earth. It is caused by the passage of the ray from space or the rarer air high in the atmosphere to the denser medium near the surface of the earth. It produces the greatest effect when the heavenly body is on the horizon, and is non-existent when it is in the zenith. It makes a heavenly body appear higher than it is, or even visible before it has really risen. Allowance must he made for refraction in all observations of altitude. The amount of refraction at a certain elevation above the horizon, for a certain

temperature of the air, and a certain height of the barometer, may be approximately determined, but minute variations in it make the corrected places of the stars occasionally wrong by a second or more. (*Ball.*)

(2) *Axis of double refraction:* [Axis].

(3) *Axis of refraction:* [Axis].

(4) *Conical refraction:*

Optics: The refraction of a ray of light into a number of other rays forming a hollow cone. It arises when a ray of light passes through biaxial crystals [*Polarisation of Light*] in a particular direction, nearly coinciding with the optic axis. When the ray, leaving the crystal, forms a cone with the apex at the point of emergence, it is called external conical refraction; when the cone is formed by the ray on entering the crystal, and it emerges in a hollow cylinder, it is called internal conical refraction. It was first reasoned out by Sir William R. Hamilton, and subsequently demonstrated experimentally by Lloyd.

(5) *Double refraction:*

Optics: Many crystals are not homogeneous, but have different properties of elasticity, &c., in different directions. The effect of such a constitution is, that unless a ray of light enters the crystal in some particular directions, it is not merely refracted in the manner described under Refraction, but divided into two rays. In this case the refracted ray or rays are not always in the same plane as the incident ray. [*Polarization of Light.*]

(6) *Index of refraction:* [Index, *s.*, ¶ (4)].

(7) *Plane of refraction:* The plane passing through the normal or perpendicular to the refracting surface, at the point of incideuce and the refracted ray.

(9) *Refraction of altitude and declination, of ascension and descension, of latitude and longitude:* The change in the altitude, declination, &c., of a heavenly body, due to the effect of atmospheric refraction.

(10) *Refraction of sound:*

Physics: The change of direction which takes place when waves of sound pass from one medium to another. It follows the same laws as light. It was discovered by Soudhauss.

(11) *Terrestrial refraction:*

Optics: Refraction making terrestrial bodies such as distant buildings or hills, &c., look higher than they really are. The principle is the same as in Astronomical Refraction. [¶ (1).]

II. *Technically:*

1. *Biol.:* The genesis or production of new tissue to supply the place of an old texture lost or removed. In some of the inferior animals an organ or a limb can thus be supplied; in man regeneration is much more limited in its operation. Thus, when a breach of continuity takes place in a muscle, it is repaired by a new growth of connective tissue, but muscular substance like that lost is not restored. Nerve, fibrous, areolar, and epithelial tissues are more easily repaired.

2. *Script. & Theol.:* The state of being born again, *i.e.*, in a spiritual manner. The word regeneration, Gr. παλιγγενεσία (*palingenesia*), occurs twice in the A.V. and R.V. of the New Testament. In Matt. xix. 28, if connected, as seems natural, with the words which follow, not with those which precede it, it refers to the renovation or restoration of all things which shall take place at the second advent of Christ. The other passage is:

"Not by works done in righteousness which we did ourselves, but according to his mercy he saved us through the washing [margin, laver] of regeneration and renewing of the Holy Ghost."—*Titus* iii. 5 (R.V.).

The doctrine of regeneration was formally expounded by Jesus in his interview with Nicodemus (John iii. 1-10). All theologians consider the Holy Spirit the author of regeneration. Two views exist as to the relation between baptism and the new birth. One considers the water in John iii. 5, and the washing or laver of Titus iii. 5 to be that of baptism, and that the administration of the rite of baptism is immediately followed or accompanied by what is called in consequence "baptismal regeneration." The other view is that the water, washing, and laver, in these passages, are but figurative allusions to the power of the Holy Spirit in removing the corruption of the heart, and that regeneration is effected quite independently of baptism by the Holy Spirit alone.

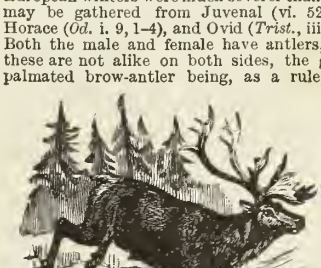
Zool.: *Rangifer tarandus*, the only domesticated species of the family. It extends over the boreal regions of both hemispheres, and runs into several well-marked varieties. Many authors consider the American reindeer, which has never been domesticated, as a distinct species. The reindeer formerly had a much wider geographical range, and is probably the *bos cervi figura* described by Cæsar as inhabiting Hercynian forest (*de Bell. Gall.* vi. 26). That the European winters were much severer than now may be gathered from Juvenal (vi. 521–3), Horace (*Od.* i. 9, 1–4), and Ovid (*Trist.*, iii. 10) Both the male and female have antlers, and these are not alike on both sides, the great palmated brow-antler being, as a rule, de-



REINDEER.

veloped on one side only. In the winter the fur is long, grayish-brown on the body; neck, hind-quarters, and belly white. In summer the gray hair darkens into a sooty brown, and the white parts become gray. To the Laplander the reindeer is the only representative of wealth, and it serves him as a substitute for the horse, the cow, the sheep, and the goat. It is extensively employed as a beast of draught and carriage, being broken to draw sledges, or to carry men or packages on its back. A full-grown animal can draw a weight of 300 lbs., and travel at the rate of 100 miles a day, its broad deeply cleft hoofs fitting it admirably for travelling over the broken snow. In winter the herds feed in the woods on the lichens which haug from the trees; in summer they seek the mountains in order to escape the mosquitoes and gad-flies.

"Remains of the *reindeer* are found in caves and other Post-pliocene deposits as far south as the south of France, this boreal species having heen enahled to spread over Southern Europe, owing to the access of cold during the Glacial period. It appears to have continued to exist in Scotland down even to the twelfth century."—*Encyc. Brit.* (ed. 9th), vii. 25.

reindeer-moss, *s.*

Bot., &c.: A lichen, *Cenomyce rangiferina*, which forms the winter food of the reindeer. It has erect, elongated, roughish, very much branched podetia, the alternate branches drooping; the apothecia sub-globose, brown, on small erect brauchlets. It is common in Britain on moors, heaths, and mountains. It is abundant in the pine forests of Lapland, and flourishes even when they have been burnt. Reindeer feed upou it and dig for it when it is covered by snow. It tastes like wheat bran, but leaves a slightly burning sensation on the palate. It is not eaten by the Laplanders. It is the badge of the clan Mackenzie. [Cladonia.]

reindeer-period, *s.*

Anthrop.: The English equivalent of Lartet's *âge du renne*.

"But now comes the great question: When was the *Reindeer-period* in Southern France? and what is its antiquity? It is far easier to indicate its place in the series of observed facts in relation to ancient man, than to assign to it any definite antiquity of years. Geologically, a wide gulf separates it from the Drift-period . . . but, on the other hand, it will seem, both from the palæontological and archæological bearings, to be of higher antiquity than the Kjokkenmöddings of Denmark and the Lacustrine Dwellings of Switzerland, and very certainly than the whole group of so called Celtic and Cromlech remains."—*Lartet & Christy: Reliquiæ Aquitanicæ* (ed. T. R. Jones), p. 25.

3. That which is kept in memory of another; a souvenir, a memento.

II. *Compar. Religions:* The respect and veneration paid to relics of the departed are founded on association of ideas—that the dead person keeps up a connection with his remains—and are present in nearly every form of religion. The Spartans were enjoined by the oracle at Delphi to find and carry with them the bones of Orestes as a condition of success against the men of Tegæa (*Herod.*, i. 67, 68). Tylor (*Prim. Cult.*, ed. 1873, ii. 150, 151) gives many instances of the preservation and honouring of relics among tribes of low culture, in the present day. In Jewish history we read how when the corpse of a man "was let down, and touched the bones of Elisha, he revived, and stood on his feet" (2 Kings xiii. 21; cf. Acts xix. 12). The cultus of relics also obtains in Eastern religions; the mythical tooth of Booddha is venerated at Kandy. The Caaba is now as great an object of devotion to Muhammadans as was the shrine of a saint to medieval Christian pilgrims. But it is in the Roman Church that the veneration of relics has attained its maximum. Addis and Arnold (*Cath. Dict.*) define relics to be "bodies, or fragments of the bodies, of departed saints, articles, or portion of articles, which they have used, the holy nails, lance, spear, or fragments of the True Cross, and the girdle, veil, &c., of the Blessed Virgin." Devotion to relics, which dates from very early times, rests on two grounds: (1) Honouring the bodies of the dead who sleep in Christ; and (2) the belief that God is sometimes pleased to honour the relics of his saints, by making them the instruments of miracles. All Roman altars contain some relic or relics, placed in a special repository called the sepulchre. Relics are usually venerated in public by being exposed in their reliquaries on the altar, with burning lights. A special mass and office may be said in churches possessing an important relic (*insignis reliquia*) of a saint named in the Martyrology. In the Roman Breviary there are special offices for the Most Holy Relics (to be said on the fourth or last Sunday in October), for the Crown of Thorns, the Lance and Nails, &c.

"Abuses have, no doubt, occurred in all ages with regard to relics. In 1215, canon 62 of the Fourth Lateran Council forbade *relics* to be sold or to be exposed outside of their cases or shrines, and prohibited the public veneration of new *relics* till their authenticity had been approved by the Pope."—*Addis & Arnold: Cath. 2. *Eng. Law:* An estate in remainder is defined to be an estate limited to take effect and be enjoyed after another estate is determined. Thus if a man seized in fee-simple grants lands to A for twenty years, or other period, and, after the determination of the said term, then to B and his heirs for ever, here A is tenant for years, with remainder to B, since an estate for years is created out of the fee, and given to A, and the residue or remainder to B. Remainders are either contingent, cross, or vested (or executed) remainders. A contingent (or executory) remainder is where the estate in remainder is limited to take effect either to an uncertain person, or upon an uncertain event; so that the particular estate may chance to be determined, and the remainder never take effect. A cross remainder is where each of two grantees has reciprocally a remainder in the share of the other. Thus, if an estate be granted as to one half to A for life, with remainder to his children in tail, with remainder to B in fee-simple; and as to the other half to B for life with remainder to his children in tail, with remainder to A in fee-simple, such remainders are called cross-remainders. Vested (or executed) remainders are those by which a present interest passes to the party, though it is to be enjoyed in future, and by which the estate is invariably fixed to remain to a determinate person after the particular estate is spent, as if A be tenant for years, remainder to B in fee: here B's remainder is vested, which nothing can defeat or set aside.

In a still narrower sense applied to the style of architecture which succeeded the Gothic [RENAISSANCE-ARCHITECTURE], and that peculiar style of decoration revived by Raphael in the pontificate of Leo X., resulting from the discoveries made by him of the paintings in the then recently exhumed Thermæ of Titus, and in the Septizonia. It was freer than the antique.

renaissance-architecture, *s.*

Arch.: A style which first sprang into existence in Italy in the beginning of the fifteenth century. It reached its zenith in that country in the course of the same century, and at the beginning of the following became a model for all other countries. At the early epoch of its existence the new style of architecture displays not so much an alteration in the arrangement of the spaces and of the main features of the buildings, as in the system of ornamentation and in the aspect of the profiles. During the early period there was an endeavour to adapt classical forms with more or less freedom to modern buildings, whilst later, that is in the sixteenth century, a scheme based on ancient architecture was universally prescriptive. Two distinct styles belong to this first period, each possessing its especial peculiarities. These are: the Early Florentine and Early Venetian Renaissance styles. The style may be said to have originated with Brunelleschi of Florence (died 1446), and Ambrogio Borgognone of Pavia in 1473. The Venetian Renaissance style first sprang into existence towards the end of the fifteenth century and flourished till the close of the sixteenth. It is chiefly remarkable in connection with the architecture of palaces. The decoration appears to have been borrowed from Byzantine models. Palladio, the special champion of this style (born 1518, died 1580), introduced the style known after him as Palladian (q.v.). The first and most important school of the Roman Renaissance was originated by Donato Lazzari, known under the name of Bramante (1444–1514); this was joined by Balthazar Peruzzi and Antonio di Sangallo; another school was represented by Giacomo Barozzio, known as Vignola (1507–1573), whilst a third was directed by Michel-Angelo Buonarotti (1474–1564), and by its arbitrary character formed a stepping-stone to the Rococo style which succeeded it. The finest example of these schools are the Cancellina Palace, the Court of the Vatican, the Farnese Palace, and St. Peter's at Rome. The Renaissance style was introduced into France by Fra Giocondo, under Louis XII., about 1502, and by Serlio and other Italian architects under Francis I. (1515–1547) and Henry II. These architects modified their ideas to suit the French taste; the general arrangement of the Gothic churches being retained, and only the Renaissance system of decoration substituted for the Gothic: the ground-plan, the proportions, and the whole structure with its flying buttresses, pinnacles, clustered columns, deeply-recessed portals, &c., are borrowed from the Pointed style, and it was only in the details and in the ornamentation that the Renaissance was followed. The Louvre and the earlier portions of the Tuileries are examples of this style. The Renaissance style was not employed in Germany before the middle of the sixteenth century, and the most noteworthy instances of it are the Belvedere of Ferdinand I., on the Hradschin at Prague, and the so-called Otto Henry Buildings at Heidelberg Castle (1556–1559). In Spain an Early Renaissance style appears—a kind of transitional Renaissance belonging to the first half of the sixteenth century. It consisted of the application of Moorish and pointed arch forms in conjunction with those of classical antiquity; in this way a conformation was produced which was peculiar to Spain, and the style is characterized by bold lightness, by luxuriance in decoration, and by a spirit of romance. The Italian Renaissance style was introduced into England about the middle of the sixteenth century by John of Padua, the architect of Henry VIII. The most noteworthy examples of it are Whitehall Palace, by Inigo Jones, and St. Paul's and other churches, by Sir Christopher Wren.

rĕnt (2), * **rente,** *s.* [Fr. *rente* = rent, revenue, from *rendita*, a nasalized form of Lat. *reddita* (*pecunia*) = (money) paid, fem. sing. of *redditus*, pa. par. of *reddo* = to give back, to render (q.v.); Ital. *rendita* = rent; O. Sp. & Port. *renda*; Sp. *renta*; Dut., Dan., & Ger. *rente*; Sw. *renta, ränta*; Icel. *rentá.*] A sum of money, or other valuable consideration, payable periodically for the use of lands or tenements; the return made to the owner by the occupier or user of any corporeal inheritance. It does not necessarily consist in money. Bithell (*Counting House Dictionary*) says:

"The word has three different meanings, which it is important to distinguish:—
1. In common speech, it signifies the payment periodically made for the use of lands, houses, or property of any kind.
2. In legal phraseology, it signifies the right to demand payment for the same, not the payment itself.
3. In political economy the meaning is more restricted, and is applied to the payment annually made for the use of . . . lands employed simply for the production of such wealth as is yielded by tilling it."

Rents, at common law, are of three kinds, *rent-service, rent-charge,* and *rent-seck. Rent-service* is when some corporal service is incident to it, as by fealty, and a sum of money; *rent-charge* is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear; *rent-seck* (dry rent) is rent reserved by deed, but without any clause of distress.

"*Rent* is an incorporeal heriditament, and signifies a compensation or acknowledgment given for the possession of some corporeal inheritance, being defined as certain profit issuing yearly out of lands and tenements corporeal. It must be a profit; yet there is no

occasion for it to be money: for capons, corn, and other matters may be rendered by way of *rent*. It must issue out of lands and tenements corporeal; that is, from some inheritance whereunto the owner or grantee of the *rent* may have recourse to distrain. Therefore a *rent* cannot be reserved out of an advowson, a common, an office, a franchise, or the like. *Rent* is regularly due and payable upon the land from whence it issues, if no particular place is mentioned in the reservation. And strictly it is demandable and payable before the time of sunset of the day whereon it is reserved, though perhaps not absolutely due till midnight."—*Blackstone: Comment.*, bk. ii., ch. 3.

¶ Adam Smith considers rent as the price paid for the use of land. Ricardo and his followers considered that the rent of superior soils is equal to the difference between their produce and that of the worst soils cultivated. There is great doubt as to the accuracy of this view. Land let by a landlord to a tenant for purpose of cultivation is analogous to money lent to a borrower. The rent of the land is virtually the interest on the land viewed as a loan.

¶ The publication of the debates in the Houses of Parliament was long forbidden, and in 1771, Miller, printer of the *Evening Mail*, was arrested for committing the offence. The Lord Mayor released him, and was in consequence sent to the Tower. In 1772 the debates were again published. This time, however, no arrest took place. Every important newspaper has a staff of reporters. When a long debate has to be taken down, the first reporter makes notes for a certain period, and then goes to write out his manuscript and hand it to the printers. The process goes on till the debate closes. During the present century the reporting of events for newspapers has become an important element of modern enterprise, particularly in the United States, where everything of public interest is quickly published. During war times reporters incur the greatest risks in the gathering of news, and reporters have been sent out on exploring expeditions to Africa, and other distant regions.

Reprobate occurs both as an adjective (Jer. vi. 30; Rom. i. 28; 2 Tim. iii. 8; Titus i. 16) and as a substantive (2 Cor. xiii. 5, 6, 7). *Reprobatio* was used by Tertullian (*Apol.* xiii.), adopted by the Swiss theologians, and Anglicised as reprobation. The doctrine is thus stated in the *Westminster Confession of Faith*, iii. 7, the name reprobation, however, not being used:

§ "The rest of mankind [i.e., all but the elect] God was pleased, according to the unsearchable counsel of his own will, whereby he extendeth or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures to pass by, and to ordain them to dishonour and wrath for their sin, to the praise of his glorious grace."

Calvinists adduce in support of the doctrine Rom. ix. 11-22; 1 Thess. v. 9; 1 Pet. ii. 8; Jude 4, &c. The 17th Article teaches the predestination to life of "those whom he [God] hath chosen in Christ out of mankiud," and is silent as to the fate of others.

¶ Reproduction of animals is of two kinds, sexual [GAMOGENESIS, HOMOGENESIS] and non-sexual [XENOGENESIS]. The former is effected by the contact of a germ cell or ovum and a sperm cell or spermatozoöid. When the former is present in a female and the latter in a male, the species is said to be

dicœcious; when there is only one individual, the terms used are hermaphrodite, androgynous, or monœcious. Non-sexual, agamic, or asexual reproduction is by gemmation and fission, by internal gemmation, by alternation of generations, or by parthenogenesis (q.v.). In plants also there is a sexual and an asexual reproduction. The former is by germ cells or oospheres, the latter by spores, gemmæ, bulbils, conidia, buds, gonidia, &c.

At the present epoch, indeed, birds are strikingly differentiated from *reptiles*, but the discoveries within recent years of a number of extinct birds with Reptilian character offer ample evidence that birds are the descendants of some branch or branches of the Reptilian type in which the power of flight was developed, and with it other anatomical peculiarities by which birds are now distinguished from living *reptiles.*"—*St. G. Mivart*, in *Encyc. Brit.* (ed. 9th), xx. 442.

rĕp-tĭl′-ĭ-ą, *s. pl.* [Lat., neut. pl. of *reptilis.*] [REPTILE.]

1. *Zool.:* A class of Huxley's vertebrate section Sauropsida (q.v.). They are cold-blooded, oviparous, or ovoviviparous. Vertebrate animals having the skin covered with scales or scutes. Heart with two auricles, ventricular chamber incompletely divided. Respiration takes place by lungs; respiratory movements slow and irregular. Intestinal tract and urogenital organs open into a common cloaca. When the appendicular parts of the skeleton are present, the sternum is never replaced by membrane bone, and the posterior sternal ribs are attached to a median prolongation of the sternum. The metatarsal bones are not anchylosed among themselves or with the distal tarsal bone. The fœtus is enclosed in an amnion and allantois, and nourished from the vitellus. Its literature dates from Aristotle (B.C. 384–322). Some progress in classification was made by Ray (1628–1705) and Linnæus (1707–78). [AMPHIBIA.] Bronguiart, in 1799, first recognized the characters by which the Batrachia (q.v.) differ from other reptiles, and form a natural passage to the fishes. In the beginning of this century Oppel, Duméril, and Cuvier worked assiduously on the material accumulated in the Paris Museum, and were followed by Blainville, Merrem, Latreille, Gray, and Wagler. In 1854 appeared the ninth and last volume of the *Erpétologie Générale* of Duméril and Bibron, having been twenty years in progress. In 1863, in his Hunterian Lectures, Huxley adopted the term Sauroids for that division of the Vertebrates which he afterwards called Sauropsida. He divides the Reptilia (*Anat. Vert.*, p. 196) into the following orders: Chelonia, Plesiosauria, Lacertilia, Ophidia, Ichthyosauria, Crocodilia, Dicynodontia, Ornithoscelida, and Pterosauria. Owen makes reptiles proper the highest of the five sub-classes into which he finally divided his Hæmatocrya with nine orders.

Ichthyopterygia (extinct), Sauropterygia (extinct), Anomodontia (extinct), Chelonia, Lacertilia (with the extinct Mosasaurus), Ophidia, Crocodilia (with the extinct Teleosaurus and Strepospondylus), Dinosauria (extinct), and Pterosauria (extinct).

Prof. Mivart (*Encyc. Brit.* (ed. 9th), xx. 442–45) divides the Reptilia into the following ten orders:

Ichthyopterygia (extinct), Anomodontia (extinct), Dinosauria (extinct), Ornithosauria (extinct), Crocodilia, Rhynchocephalia, Sauropterygia, Lacertilia, Ophidia, and Chelonia.

2. *Palæont.:* The first appearance of reptiles is believed to be indicated by remains of a marine Saurian (*Eosaurus acadianus*) of Carboniferous age. Froterosaurus is found in the Permian. In Mesozoic times the Reptilian type appears in such variety and in such a high state of development that this era has been distinguished as the Reptilian age. In the Trias large marine Saurians and Dinosaurs are met with; the more gigantic forms were developed in the Jurassic period; and the class attained its highest culmination in the Chalk. Sir R. Owen's *British Fossil Reptiles* is the best authority on the subject with which it deals.

* 1. The common or public weal or good.

"The world is full of vanity; and fond fools
Promise themselves a name from buildiug churches,
Or anything that tends to the *republic*.
Randolph: Muses' Looking Glass, iii. 1.

2. A commonwealth; a form of political constitution in which the supreme power is vested, not in an hereditary ruler, but in the hands either of certain privileged members of the community or of the whole community. Theoretically, the purest and most perfect form of a republic is a state in which all the members of the community meet in public assembly to enact laws, and transact all other national business. Such a system is, however, practicable only in very small states, and has, therefore, given way in all modern republics to the representative system—that is, one in which the supreme power is vested in rulers chosen periodically by and from the whole body of the people, or by their representatives assembled in a congress or national assembly, as in the present French republic. The republics of Venice and Genoa were exclusive oligarchies, the supreme power being vested in the nobles or a few privileged persons. The republics of the United States and Switzerland are federal republics—that is, composed of a number of separate states bound together by treaty, subject to a central government for all national purposes, but having powers of self-government in matters affecting individual states.

* 3. One's country at large; the state, the public.

"And life, state, glory, all they gain,

(2) *Resolution of forces or of motion:*

Mech.: The dividing of any single force or motion into two or more others, which, acting in different directions, shall produce the same effect as the given motion or force. Let A D represent a force; draw any parallelogram A B D C, having A D as a diagonal; then by the Parallelogram of Forces (q.v.), the force represented by A D is equivalent to two forces represented by A B and A C respectively. And since an infinite number of parallelograms can be drawn, having a given line for their diagonal, any force can be resolved into two others in an infinite number of ways. Similarly, if three forces act upon a point, and their resultant be required, find the resultant of any two of them; the composition of this resultant with the third force will give the resultant of the three given forces. In like manner, the resultant of any number of forces acting upon a point may be found.

Astron.: The exhibition, by means of a very powerful telescope, that the diffused light of a nebula is really that of a multitude of exceedingly distant stars.

¶ The nebulæ, as ordinarily seen, are cloudy patches of light in the heavens, usually seen only in telescopes of considerable power. Still more powerful telescopes have "resolved" many of them into clusters of stars. It was for a time maintained that all nebulæ were thus resolvable, and that merely an increased telescopic power was necessary to prove that only stars and planets existed in the heavens. The use of the spectroscope (q.v.) has disproved this theory, and made it evident that actual nebulæ exist, star stuff made up of vapor or meteoric clusters from which solar bodies will perhaps eventually emerge.

Cromwell supported the latter. The sufferings through which both passed after the Restoration in 1660 again fused them into one.

* 3. An interval.

II. *Technically :*

1. *Physiol. :* The process of breathing, in which oxygen is taken into the lungs by inspiration, and carbonic acid expelled by expiration, the carbonic acid being given out by the blood, and oxygen taking its place. When respiration is interfered with, asphyxia takes place, except in hibernation (q.v.). The action of respiration exposes the blood to the air, and, by mutual diffusion, the two actions of oxygenating the blood and freeing it of carbonic acid are accomplished by the same act, thus resembling the endosmose and exosmose of liquids. In the higher animals, the capillaries are connected with the arteries immediately issuing from the heart, effecting a constant renewal in the blood, and, by a serics of muscular movements fresh air is supplied, and vitiated air removed alter-

nately, owing to nervous reflex action, not dependent on the will, as the same process goes on in sleep, and in other unconscious states. The lungs themselves are almost passive in the process. In the lowest and simplest forms of animals, the aquatic, no special apparatus is provided for the aëration of the fluids of the body, this being effected by the general movements of the body, or by cilia (q.v.), producing the necessary currents. In bivalve molluscs, the internal surface of the mantle or skin-lining of the valves is in some cases the special organ of respiration; in others, the mantle is convoluted into four folds, fringed at the edges, with the same action as gills in fishes. The transition from gill-like tufts in animals which can either breathe air or water, as the leech and the earth-worm, is seen in the formation in them of small sacs at regular intervals on each side of the body, opening by a row of pores termed spiracles or stigmata. In insects, the spiracles open into tubes, which communicate with each other through the body, and are prevented from closing by an elastic spiral fibre winding round them, serving the purpose of the cartilaginous rings in the trachea and bronchi of the air-breathing vertebrata; in spiders, the respiratory apparatus becomes more concentrated, and through the different classes of animals there is a gradual leading-up to the delicate and highly organised apparatus seen in the higher vertebrata. [LUNGS.] The number of the respiratory movements in health are from fourteen to eighteen per minute. Besides carbonic acid, watery vapour and a minute quantity of organic matter are exhaled in respiration, the latter varying in accordance with the state of the digestive apparatus.

2. *Bot.:* A term occasionally used for the process in plants somewhat analogous to that of respiration in animals. A plant takes carbon deoxide from the atmosphere, decomposing it under the action of chlorophyll and light, emitting the oxygen, and retaining the carbon to build up the vegetable structure. During darkness, oxygen is absorbed and carbon dioxide given off, but not in quantities so great as to vitiate the atmosphere of the room in which flowers in pots are kept.

3. *Pathol.:* In effusion of pus into the pleura the respiration is bronchial, in one stage of phthisis it may be cavernous, in another puerile.
